"WINTER MORNING, NEW YORK CITY" was hung in the principal photographic salons in 1939 and won several prizes; it was taken by H. J. Phillips, a member of the Camera club of New York

Photography, Miniature Camera. As the miniature camera offers many advantages and conveniences such as small size, light weight, ease in taking many exposures, fast lenses and fast shutter speeds, economy of materials, use of colour films, and other features, it is no wonder that nearly 5,000,000 new photographers have entered the field during the past ten years in England and the United States. These miniature camera owners have found a new release for their own ideas and the interpretation of all the modern activities associated with their daily living. Thrilling experiences are found in candid photography, action pictures of all kinds, children and family pictures and many others.

During the winter and spring of 1939 miniature camera photography undoubtedly had its greatest peak of popularity in the United States, England, Germany and a few other countries. The 35mm. cameras such as the Contax, Leica, Retina and others were in great demand through England and Germany. In the United States the trend toward the larger miniature camera sizes was quite noticeable. By spring and summer of 1939 the cameras making $2\frac{1}{4} \times 2\frac{1}{4}$ size negatives such as the Rolleiflex, Ikoflex, Super Ikonta B, and others were very popular. This trend continued with the introduction of the $2\frac{1}{4} \times 3\frac{1}{4}$ Speed Graphic camera in the United States. This latter camera which enjoyed enormous sales throughout 1939 attracted many photographers who had been formerly using the 35mm. cameras exclusively.

By the end of 1939 the sale of the miniature $2\frac{1}{4} \times 3\frac{1}{4}$ Speed Graphic camera in the United States was definitely on the increase along with many of the $2\frac{1}{4} \times 2\frac{1}{4}$ miniature cameras in spite of the European war which had a marked effect upon the importation of German cameras into England and the United States.

Although stocks of the German miniature cameras were not exhausted, the actual sale of the higher priced cameras fell off by the

end of 1939 to as much as 50% or more in some cases. The list prices for imported cameras remained unchanged for 1939 even after the war started.

The 35mm. cameras represented the greater number of miniature camera sales in England and Germany during the first nine months of 1939, while in the United States the balance was gradually changing from the smaller size miniature cameras to the twin lens reflex cameras such as the Rolleiflex and the Ikoflex, with the new $2\frac{1}{4} \times 3\frac{1}{4}$ miniature Speed Graphic camera heading the list of the larger size miniature camera demand in the United States.

Undoubtedly one of the factors creating this trend toward the use of larger miniature camera films has been the development of Speed Flash photography. With the modern Micromatic Synchronizers, such as the Kalart, which make it possible to operate camera shutters at their highest speeds and synchronize a flash-bulb at the same time, photographers found a new aid in obtaining photographs which could not be taken before.

The new Super Speed films were another factor in the popularity of the miniature camera. With film speed increases of two to as much as six times over former films, photographers could use smaller lens stops and obtain greater depth of field in their pictures. This greater depth of field was formerly an almost exclusive feature with the 35mm. cameras and their short focal length lenses.

A third factor to be taken into consideration is the continual development of the amateur photographers' ability to discriminate between good and bad picture quality. As an average it was found that the larger negative size produced a finer tone gradation and print quality.

While there is no one universal camera, there is a definite trend toward the possession of two cameras, a 35mm. and one of the larger miniature camera sizes up to as large as $2\frac{1}{4} \times 3\frac{1}{4}$ inches.

Another development during the early part of 1939 was the deluge of cheap 35mm. cameras which flooded the markets in the United States and, to some extent, in England. These cameras were introduced under extravagant advertising claims for precision workmanship, speed lenses, candid camera qualities, etc. However, with such cheap cameras selling in the United States for as low as 98¢ and \$1.95, it was impossible to make anything of a permanent lasting value. The result of this came with the rapid decline in sales of these cheap cameras by the end of 1939. However, sales of other low priced 35mm. cameras ranging in price from \$14 to \$35 held up very well and were on the increase.

General observation shows that the 35mm. miniature camera still has a very definite place in photography. With the enormous use of 35mm. Kodachrome colour film, the 35mm. cameras are continually in demand.

Probably another barometer in the steady interest for the 35mm. camera has been the enormous sale of the *Leica Manual*. By the end of 1939 over 50,000 copies of this book had been sold in England and the United States over a period of three years. (See also PHOTOGRAPHY.)

Physics.

Nuclear Physics.—A new type of atomic disintegration was discovered in 1939 by Hahn and Strassmann in Germany. It was found that uranium, the heaviest known element, when exposed to neutrons breaks up into several different elements with atomic weights about half that of uranium. It is supposed that a uranium atom, of atomic weight 238, absorbs a neutron, so becoming a uranium atom of atomic weight 239, and that this new atom is unstable and breaks up into two roughly equal parts. Barium, antimony, tellurium, iodine, caesium and other elements are found among the products formed. Such a dis-

integration of a heavy atom into roughly equal parts is called fission. Thorium and protactinium also have been found to undergo fission when exposed to neutron bombardment.

The atomic number of uranium is 92 so that a uranium atom of atomic weight 239 contains 92 protons and 147 neutrons. If the nucleus of this atom breaks up into two parts the sum of the atomic numbers should be 92 and the sum of the atomic weights 239. However there are not among the known stable elements any two whose nuclei satisfy these conditions. For example, barium has atomic number 56, krypton 36 and $56+36=92$ but the highest atomic weight of barium is 138 and that of krypton 86 and $138+86$ is only 224 instead of 239. It is necessary therefore to suppose that the products of the fission are not stable atoms but unstable or radioactive atoms. In fact Hahn and Strassmann were able to detect the products formed by means of the beta rays which they emit. Thus the barium atoms formed have atomic weights greater than 138 and are unstable emitting beta rays.

When a beta ray is emitted a neutron changes into a proton so that when a barium atom emits a beta ray its atomic number is increased by one and it becomes a lanthanum atom. Neutrons in the unstable atoms formed by the fission change into protons with the emission of beta rays until stable atoms are formed.

The fission of a heavy atom involves the release of a very large amount of energy. The atomic weight of uranium with $0^{16}=16$, as determined with the mass spectrograph, is 238.09 and the elements with atomic weights between 80 and 120 have atomic weights equal to an integer plus 0.94. It follows that if a uranium atom changes into two stable atoms with atomic weights between 80 and 120 there is a loss of mass of $2.09-1.88=0.21$ atomic weight units. One atomic weight unit is equal to 931,000,000 electron volts so that the energy released by the fission of a uranium atom should be about 931×0.21 or almost 200,000,000 electron volts. The fission of the uranium atom therefore is an atomic explosion and the fragments fly apart with enormous kinetic energy.

Carson and Thornton at the University of California placed a thin layer of uranium in a closed expansion chamber near to a source of neutrons and obtained photographs of the tracks made by the fragments. The kinetic energy of the fragments calculated from the length of the tracks agreed roughly with that estimated from the loss of mass.

It is found that neutrons are emitted during fission so that since fission is produced by neutrons it seems possible that the fission process once started in a mass of uranium might be able to maintain itself without any supply of neutrons from outside. The neutrons readily escape from the uranium so that the concentration of the neutrons will be greater the greater the volume of the uranium.

It seems possible that in a very large mass of uranium the concentration of the neutrons due to fission, once started in the mass, might go on increasing and so the rate of fission go on increasing until the uranium was volatilized by the energy set free. However the results obtained so far seem to indicate that such results are not possible and the existence of large masses of uranium ore on the earth for millions of years confirms this.

Hahn and Strassmann's discovery of fission is important because fission is quite different from previously known atomic disintegrations. All such involved the combination of a nucleus with a particle, like a proton or deuteron, of small atomic weight, followed by the emission of another particle also of small atomic weight. For example, a magnesium atom, of atomic weight 26 absorbs a deuteron of atomic weight two and then emits a helium atom of atomic weight four so that the magnesium atom is changed into a sodium atom of atomic weight 24.

The nucleus of a heavy atom may be regarded as analogous to

CORRECT TO WITHIN $2\frac{1}{2}$ MILES PER SECOND, the first completely automatic device for measuring the speed of light was perfected in 1939 by Willmer C. Anderson of Harvard university

a minute spherical drop of water very highly charged with positive electricity. If such a drop is violently disturbed so as to become elongated the repulsion between the positive charges on its ends may be sufficient to cause it to break up into two nearly equal drops. It is supposed that fission is analogous to such a breaking up of a charged water drop.

Cosmic Rays.—On June 27-30, 1939 a congress of about 300 scientists interested in cosmic rays was held at the University of Chicago. The proceedings of this congress have been published in the *Reviews of Modern Physics* and contain many notable contributions to the subject.

The existence of heavy electrons or mesotrons, as they are now called, as an important constituent of cosmic rays has been abundantly confirmed. The primary cosmic rays which enter the earth's atmosphere from outside produce secondary rays as they pass through the air or other materials. Cosmic rays are a mixture of electrons, positrons, mesotrons, protons, neutrons, photons, and perhaps other particles but it is difficult to decide which of these are the primary rays.

Recent studies show that the neutrons increase rapidly with elevation, more rapidly than the total cosmic ray intensity but at about the same rate as photons. It is suggested that the neutrons may be due to the disintegration of atomic nuclei by high energy photons or electrons.

There is evidence that a photon or electron with energy greater than one hundred million electron volts can cause a nucleus to break up into its constituent protons and neutrons.

The very penetrating cosmic rays observed hundreds of feet below the surface of the ground are believed to be protons and mesotrons.

Cosmic ray particles with energies up to one thousand million electron volts have been observed. Such energies cannot be derived from the annihilation of any atom or indeed by any imaginable single process. It seems therefore that there must exist in nature some process by which the energy of a particle can

be increased almost without limit either continuously or by a series of increments.

Mesotrons are found to have a life of only a few millionths of a second. They are unstable and probably break up into an electron and a neutrino or a photon or both. It is clear therefore that mesotrons are not primary cosmic rays.

Magnetic Moments of the Proton and Deuteron.—An exact determination of the magnetic moments of the proton and the deuteron has been done at Columbia university by Rabi and his associates. Hydrogen gas was allowed to enter a large highly evacuated chamber through narrow slits. The molecules from the slits were focused on to a sensitive Pirani gauge detector by means of two magnets. Between the two magnets the molecules passed between the poles of a third magnet. A weak alternating magnetic field at right angles to the field of the third magnet was produced by means of the current from a high frequency oscillator.

The hydrogen molecules which act like small magnets are lined up by the field of the magnets and focused on the detector but if the alternating field disturbs this orientation the focusing is prevented which is indicated by the detector. The hydrogen molecules act like magnetic spinning tops and precess around the direction of the magnetic field. When the frequency of the alternating field is equal to that of the precession a sort of resonance effect between the alternating field and the molecules occurs and the molecules are disturbed even by a very weak alternating field. The magnetic moment of the molecules can be calculated from the frequency of the alternating field which prevents the focusing and the strength of the steady field of the third magnet. In this way it was found that the magnetic moment of a proton is 2.80 and that of a deuteron 0.86 nuclear magnetons.

Viscosity of Air.—A remarkably exact determination of the viscosity of air has been done by Bearden at Johns Hopkins university. It is important to know this quantity accurately because the determination of the electronic charge by the falling drop method depends on its value. Bearden's apparatus consisted of two concentric metal cylinders. The outer cylinder was suspended by a wire and the inner one kept rotating with uniform angular velocity. The torque on the outer cylinder due to the viscosity of the air in the space between the two cylinders was measured. The value of the electronic charge deduced from Millikan's oil drop experiments using the new value of the viscosity of air is 4.81×10^{-10} electrostatic units. This is about 1% greater than Millikan's old value 4.77×10^{-10} .

Cyclotrons.—The 200 ton cyclotron at the University of California has been placed in operation. It is being used to produce neutrons for medical purposes as well as for investigations in nuclear physics. It was reported in newspapers that the University of Texas had offered to put up about \$1,000,000 for the construction of a 2,000-ton cyclotron to give particles with over 100,000,000 electron volts energy. Such a machine would probably require 5 to 10 years to build and get operating and around \$100,000 a year for operating expenses. Several smaller cyclotrons in the United States and Europe were placed in operation during 1939.

Separation of Isotopes.—A new method of separating gaseous isotopes was developed in 1939. It depends on thermal diffusion. If a mixture of two gases with different molecular weights is placed between two plates, one hot and one cold, the concentration of the heavier gas gets greater at the cold plate than at the hot plate and that of the lighter gas greater at the hot plate than at the cold plate. To use this fact to separate isotopes the mixture of gases is put in the space between two concentric vertical metal tubes. The outer tube is kept cool by a water jacket and the inner tube is heated to about 400°C by an electric heater inside it. The hot gas near the inner tube then rises and

the cold gas near the outer tube sinks so that a circulation of the mixture goes on. The heavier gas therefore tends to collect at the bottom and the lighter gas at the top. By using several such tubes in series, each about 12ft. long, the concentration of the heavier gas in the mixture can be greatly increased and by several applications of the process the heavier gas may be obtained practically pure. For example, ordinary carbon of atomic weight 12 contains a small percentage of carbon atoms of atomic weight 13. Thus the gas methane CH_4 is a mixture of molecules of molecular weight 16 with a small percentage of molecules of molecular weight 17. By means of this new process pure methane of molecular weight 17 may be obtained. This new process will enable many mixtures of gaseous isotopes to be separated in appreciable quantities so that the pure isotopes will be available for chemists to study their chemical properties and for physicists to study their nuclear reactions. (See ISOTOPES, SEPARATION OF.)

(H. A. W.)

Physiology. Perhaps the most active fields in physiology have been the endocrine glands, the vitamins and the central nervous system. A development of great practical, as well as theoretical, importance has resulted from the study of vitamin K, the anti-haemorrhagic vitamin. Although its complete chemical structure is not yet elucidated, related synthetic substances which exhibit a high degree of biological activity have been prepared. In the absence of bile in the intestine the vitamin is not adequately absorbed; as a result, certain of the clotting elements of the blood are reduced to the point where haemorrhage occurs. These studies have provided an explanation and a therapy for certain types of human haemorrhagic diseases and new information regarding the process of blood coagulation. Vitamin E, the anti-sterility vitamin, has been synthesized, and the results of experiments conducted on a variety of animal species indicate that this element is essential for the maintenance of nervous and muscular tissues as well as reproductive tissues. Whether Vitamin E is required by man is not certain. Extensive investigations in man have demonstrated that nicotinic acid is the long-sought pellagra-preventive vitamin. It possesses dramatic curative properties when administered to the pellagrin. Careful studies of Vitamin G, or riboflavin, deficiency have served to reveal the characteristic symptoms in man as well as in other species. Vitamin B₆, whose deficiency in rats causes severe dermatitis of the extremities, has been synthesized and recent information suggests that this nutritional factor is concerned with the metabolism of the essential fatty acids. Evidence has been advanced that Vitamin B₆ is required by the human organism. Pantothenic acid,

originally designated as a component of Bios, a complex required for the growth of yeast, appears to be identical with a vitamin whose deficiency in chicks produces a severe dermatitis. The year 1939 has seen several proposed new additions to the growing family of vitamins, but it is too early to appraise dependably these claims. An important development in the field of vitamins has been the realization that many of them function as components of various enzyme systems of the body. This relationship between the two fields has stimulated activity and materially aided progress in the study of vitamins and tissue respiration. An enormous amount of investigation in the latter field has contributed innumerable new details and principles which will serve as a basis for future understanding of the mechanism by means of which the living organism releases energy and carries on its diverse and complex activities.

Endocrinology.—In the field of endocrinology equally important advances have been made. Prolan, a hormone obtained from the urine of pregnant women and which stimulates the gonads, appears to have been conclusively demonstrated to originate in placental tissue. Synthetic female sex hormones have been prepared which are much simpler in their chemical structure than the naturally occurring products, but which, nevertheless, exert identical influences on the sexual apparatus. As a result of the development of new methods for determining the urinary excretion of the hormones of the corpus luteum, it has been possible to study in more detail the activities of the latter endocrine structure in normal, diseased and pregnant women. It has been repeatedly demonstrated that both male and female sex hormones are produced in either sex, and that to a certain extent the male and female hormones are bisexual in the effects which they produce. A relationship has been shown to exist between sex hormones and the hormones of the adrenal cortex, a finding which has contributed the solution of important questions in physiology and in medicine.

Our knowledge of hermaphroditism has been substantially advanced by detailed studies of intersexuality produced experimentally in a variety of mammalian forms by the administration of sex hormones. The endocrine activity of the placenta has been shown to play an important rôle in the maintenance and termination of pregnancy. Recent methods which permit microscopic observation of bits of living thyroid tissue in animals promise to yield valuable information regarding the activities of this endocrine gland. Study of the pituitary hormones, their effects, and the regulation of their production continues and new pituitary hormones are still being proposed.

Nervous System.—The physiology of the central nervous system has been investigated with increasing intensity. In particular, important studies on the hypothalamus have contributed to our knowledge of its role in the regulation of autonomic function, emotional states, sleep, thermal regulation and control of the endocrine activities of the hypophysis. Fruitful researches have been conducted on the complex functions of the motor, sensory, and associative areas of the cerebral cortex and their relationship to the cerebellum and mid-brain. Improvements and refinements in the technique of recording and interpreting the so-called brain waves, obtained with the aid of the electroencephalograph have been introduced and widely adopted. Pineapples. Production of pineapples in the United States in 1939 (all in Florida) was estimated by the Department of Agriculture as 15,000 boxes, compared to 20,000 boxes in 1938 and a 10-year (1928-37) average of 13,750 boxes. Exports of canned pineapples and juice from Hawaii the first 11 months of 1939 were reported by the U.S. Department of Commerce as approximately 19,600,000 cases, or about 3,000,000 cases more than in the same period in 1938. Owing to increased world demand for canned pineapple for the short season in British Malaya, ending March 31, 1939, the Central Board authorized an increase in production from 850,000 to 1,030,726 cases. The British Malaya production quota for the main season, April 1 to Sept. 30, 1939, was 1,000,185 cases. Under this control only nine of the 16 canneries operated, six remaining idle and receiving their supplies from the operative canneries in order that those in operation might run at more economical capacity. Exports of pineapples from Havana to the United States for the season ending June 30 were, "pineapples in crates, number, 1,212,347" in 1939 and 947,048 in 1938, while bulk exports were 1,601,488 lb. in 1939 and 4,921,134 lb. in 1938. Decrease in Cuban bulk exports was because of activity in Cuba to process the fruit there and then export it, rather than to ship it to United States canneries for processing.

Pittsburgh, a city in southwestern Pennsylvania, had an estimated population of 702,000 in 1939 and an area of 54.295 square miles. In the November elections the city and county remained in the ranks of the Democratic party.

At the 37th annual International Art Exhibit, held in the galleries of Carnegie Institute, though five nations were represented, five of the seven major winners of awards were American. First prize was awarded to Alexander Brook, an American from New York city for his painting "Georgia Jungle"; and the second award went to the American-born Yasuo Kuniyoshi of Woodstock, N.Y., who exhibited "Lay Figure—1938." The Pittsburgh Symphony, enjoying a second successful season under Conductor Fritz Reiner, was enabled to extend its activities to include a series of special concerts for high school students and held in their school auditoriums by a special grant of \$50,000 from the Buhl Foundation.

The Pittsburgh Housing Authority, with an \$18,000,000 fund, 90% of which comes from the Federal Government, began construction of three large-scale housing projects, all located in the upper Hill District. The planning and construction of Terrace Village No. 1 and Terrace Village No. 2 is one of the most spectacular in the United States, for more than 2,000,000 cu.yd. of earth must be removed from three rugged hills. The project includes a 14ac. public playground, and when completed will house at low rents approximately 3,000 families.

In co-operation with the Pittsburgh Housing Association, a private Community Fund Agency, the Bureau of Sanitation has demolished hundreds of unsafe and unsanitary dwellings, and the Department of Health has corrected unsanitary conditions in several thousand houses. The Community Fund drive, November 13-30, 1939, raised \$2,552,000.

Formal dedication of the Buhl Planetarium and Institute of Popular Science, a gift to the city in memory of Henry Buhl, Jr., by the Buhl Foundation, took place late in October. In addition to the Planetarium the building houses a lecture hall which is equipped to present educational and scientific motion pictures, and

five galleries to be devoted to free scientific exhibits telling popularly the story of physics, chemistry, astronomy and other sciences. This, the fifth planetarium in the U.S., cost approximately \$1,100,000.

The significant industrial news of 1939 was the phenomenal business recovery in the latter half of the year. During the first six months bituminous coal production was low because of labour disturbances. Despite this, recovery was such as to have a production, during the year's first 11 months, 17% (for the State) greater than that of the same period the preceding year. New highs in production were reached in pig iron, 839,000 tons in November—12,000 tons greater than the previous high in Aug. 1929; in electric power sales to industrial users; in retail sales, which were approximately 5% greater than in 1938. During the month of December there was a general levelling off of business, but the general business index (based on the 1923-25 average) was estimated at 93.3% for the year. (J. G. Bo.)

Pius XI (1857-1939) was elected pope in 1922. He was born at Desio, near Milan, on May 31, the son of Francesco Ratti, silk manufacturer. At baptism, he was named Ambrose Damien Achille. Educated at the seminary in Milan, later at the Lombard college and the Gregorian university, Rome, he was ordained priest on Dec. 20, 1879.

After further study and a brief curacy, Father Achille Ratti was named professor of sacred theology at the Grand seminary, Milan, in 1882. Six years later, he joined the staff of the Ambrosian Library, Milan, as a member of the college of doctors. In 1907, he became prefect of the Ambrosian, and effected a complete modernization program. During these years he published several learned studies, dealing especially with Latin palaeography. He exercised the priestly ministry as chaplain of the Cenacle nuns. His vacations were spent mountain-climbing in the Alps, about which he wrote memoirs. In 1912 he was called to Rome as vice-prefect of the Vatican library, and later became prefect.

His future was changed in 1919 when he was impressed into the Vatican diplomatic service and sent as nuncio apostolic to Poland. At the same time, he was consecrated titular archbishop of Lepanto. His position as nuncio during the years following the war was difficult but was accomplished with the approval of all parties.

In June 1921 he was named archbishop of Milan and cardinal. Upon the death of Benedict XV, the following year, Cardinal Ratti was elected pope on February 6 and crowned as Pius XI on February 11.

Tremendous activity marked his pontificate. Notable among his achievements was the settlement of the Roman question by the Lateran treaty and the Concordat with Italy, Feb. 11, 1929. He laboured incessantly for the creation of peaceful relations between nations, and for peace between the church and Governments. Likewise, he was a vigorous, dynamic leader in the regeneration of human society and in the spiritual advance of the church. His numerous encyclicals are classic treatments of international, economic, social, and spiritual topics. Courage and gentleness, awareness of the world, and closeness to the teachings of Christ characterized his pontificate. Mourned universally, he died on February 10, in his 82nd year. (See also RELIGION; ROMAN CATHOLIC CHURCH.) (F. X. T.)

Pius XII (1876-) was elected by the College of Cardinals as the 262nd Pope on March 2, his 63rd birthday, and was crowned on March 12. He was born in Rome, the son of Filippo Pacelli, dean of the Vatican Advocates, and baptized with the name of Eugenio. Following his ordination to the priesthood on April 2, 1899, he continued special courses in civil and canon law.

Eugenio Pacelli entered the Papal Secretariat of State in 1901. When the codification of canon law was begun under Cardinal Gasparri, he was engaged as assistant. Meanwhile, he carried on his priestly ministrations and preached frequently. In 1914, he was named secretary to the Congregation for Extraordinary Ecclesiastical Affairs. *

The then Pope, Benedict XV, on April 20, 1917, chose Monsignor Pacelli for the delicate office of Apostolic Nuncio to Bavaria, the only diplomatic contact between war-torn Germany and the Holy See. On May 13, he was consecrated titular bishop of Sardes. Upon the establishment of the German Republic, he was instrumental in negotiating a nunciature, and was named first nuncio to Germany, establishing his residence in Berlin in 1925.

In recognition of his services in Germany, he was called to Rome and, on Dec. 16, 1929, was created Cardinal. This was preparatory to his appointment by Pius XI, on Feb. 7, 1930, as Papal Secretary of State. During the next nine years, his public life merged with the achievements of the dynamic pontificate of Pius XI.

As Papal Chamberlain, Cardinal Pacelli announced the death of Pius XI on Feb. 10, 1939. Sixty-two Cardinals assembled for the election of a new Pope on March 1. On the third ballot of the first day of voting, March 2, Cardinal Pacelli was chosen Pope, and assumed the name of Pius XII. He was crowned with the triple tiara on March 12, in the presence of some 125,000 spectators assembled in the square before St. Peter's.

During the first year of his pontificate, Pius XII devoted himself to the cause of world peace. His first address, broadcast to the world on the morning after his election, was an appeal for peace within and among nations. Again, at Easter, he renewed his demand for peace and his condemnation of war acts. On April 20, he ordered a "crusade of prayer" for the preservation of peace.

During May and June, he sought by diplomatic approaches to Great Britain, France, Italy, Germany and Poland, to prepare for a peace conference.

Though his advances were received favourably, his proposals were not accepted by the Governments. He continued, nevertheless, to strive through the summer to ease the tension, especially between Poland and Germany. On August 31, as a final act, he urged a five-power conference to avert hostilities and to seek revision of the Versailles Treaty.

During September and October, he seized every opportunity to plead for the avoidance of war horrors, especially against civilian populations. Courageously, he showed sympathy with Poland, after the German aggression and the Russian invasion, and condemned both Governments. On November 10, he intimated the need for "a stable organization of nations."

Pope Pius welcomed the proposals looking toward parallel peace efforts of religion and government issued by President Roosevelt on December 23. Speaking before the Cardinals on Christmas Eve, he laid down five points necessary for "a just and honourable peace," namely, the right to life and independence of all nations, acceptance of the principle of disarmament, a system of international arbitration, recognition of the just demands of nations, peoples and minorities, and acceptance by peace negotiators of the principles of justice and charity.

On October 27, he issued his first encyclical, *Summi Pontificatus*, dealing with the unity of human society. His *Sertum Laetitiae*, dated November 11, directed to the hierarchy of the United States, treated of American problems. Despite the stress of his peace efforts, he continued through the year holding audiences and making addresses, six of which were broadcast internationally. On December 28, the Pope visited the King and Queen of Italy, breaking a precedent of 70 years.

(F. X. T.)

Plastics Industry. As was predicted in 1938, the field of plastics was expanded still further in 1939. The infinite variety of objects that can be made from plastics is beginning to capture the imagination of the public and popular magazines as well as scientific journals published articles on plastics and the beautiful and useful products that can be made from them.

The re-armament program in Europe altered the program of plastic production in the European countries, reducing the production of phenol-formaldehyde moulding powder and increasing the manufacture of laminated phenolics. As always, most Government reports deal more with exports and imports than with production and estimation is reduced to "guess work." Reports on synthetic resin throw together resins used for plastics and for other uses such as paints and adhesives, and it is believed therefore that 1938's estimate on synthetic resins was high.

With the above explanation, we estimate the 1938 world production of cellulose derivative plastics to be 84,000 short tons, and that of synthetic resins to be 121,000 short tons.

More intelligent and artistic designing of plastic articles was apparent and plastics are now standing upon their own merits, the time being past when they were merely substitutes for accepted materials, and were accordingly made to simulate such materials. They are now filling many structural and utilitarian purposes.

The further development of injection moulding powders and multiple unit injection presses was accompanied by the wider use of plastics in automobile construction, such as steering wheels, radiator grilles, instrument panels, directional signs, and window reveals. Greater use of automatic compression type presses also helped in this development.

Phenol-formaldehyde thermosetting resins continue to lead other plastics in volume, partly because of an extended use of laminated sheets in architecture and decorations. Very large sculptural castings were made for the New York World's Fair. Industrial uses were music box assemblies lighted from within, impellers and rotors of pumps, chemical and sanitary piping and electric shaver cases. The use in radio cabinets was greatly extended, particularly in the case of the furfuralphenol resins because of their resistance to scorching during moulding.

Development of urea-formaldehyde resins was largely in improvements in structural design and better control of colour, these resulting in a rapid growth of the use of urea plastics for illuminated signs. There was also an increased use in laminations. Large sections such as refrigerator doors and store fronts were introduced.

Nylon, the new synthetic fibre introduced in 1938, found success as a bristle material for tooth brushes and hair brushes. In 1939, fishing leaders and surgical sutures from this strong synthetic material were introduced.

New uses of cellulose acetate moulding powder included moulded duck pins and shoe heels. Cellulose acetate rigid sheeting found use in making transparent containers for hats, garment accessories and other luxury articles. Acetate film, because of its light weight and its property of ultra-violet transmission, is being used for hot bed frames and solarium enclosures. In some places cellulose acetate butyrate was introduced in place of cellulose acetate because of its greater moisture-resistance and it was therefore used for flat sections such as instrument panels and glove compartment doors.

The acrylic resins, particularly methyl methacrylate, have gone ahead by leaps and bounds. Divers uses of both cast resins and moulding powders have been found. The use of methyl methacrylate dentures has become wide-spread in England and the United States, new methods of application having been developed which make the material more easily worked by dental technicians.

Highway lighting reflectors have increased in use and spectacle lenses are now being made to prescription by moulding. The edge-lighting property of methyl methacrylate resin has led to increased use in signs and displays and the use of "piped light" in the surgical field is on the increase. Polyvinylacetyl resin as the interlayer in safety glass is now used in practically all automobiles manufactured in the United States, and in some of Canadian manufacture. Thus far there is no other important use of resins of this type.

Other vinyl resins, including polyvinyl chloride, polyvinyl acetate and after-chlorinated polyvinyl chlorides, found use for adhesives, impregnation of fabric for wrapping pipe lines, impregnation of silk for raincoats, injection moulded articles, extruded cable coatings, slide rules and triangles, book bindings and storage batteries. Polystyrene, heretofore available chiefly in Germany, was produced in the United States and found service as acid bottle adapters, cosmetic packages, refrigerator knobs and dials, transparent dishes and condenser insulation. Its use in Germany was greatly extended over that of 1938, an estimated sale of 2,000 tons being reported.

Information as to specific European developments is meagre and unreliable because of the war. After the war clouds have cleared, reports of startling developments will probably be obtained. Plastic Surgery: see SURGERY.

Platinum. No data have been published on the Russian platinum output since 1926, and data on exports are incomplete; since these figures vary widely from year to year, the world totals fluctuate accordingly, and do not represent a true picture of the industry, as it is not known how much of the Russian shipments is from current production and how much from accumulated surplus stocks from previous years. The world supply in 1938 is estimated to have been in excess of 400,000 ounces.

From 12,500 oz. in 1929, the Canadian production increased to 161,300 oz. in 1938, with prospects for a further increase in 1939. The next largest producer is Colombia, with an output which has dropped in the past few years from 55,000 oz. to less than 30,000 ounces. The fourth large producer is South Africa, which had a high figure of 45,500 oz. in 1930, but averaged about 26,000 oz. from 1934 until it rose to 31,200 oz. in 1937, and to 42,300 oz. in 1938; production continued to increase in 1939, and for the first eight months of the year was at the record rate of 58,000 ounces. The United States output stands fifth in the list, the yield since 1935 having been boosted above the previous level by a new placer deposit in Alaska. In 1938 the recovery of by-product platinum was 3,800 oz., and of placer crude 42,000 oz., the exact platinum content of which is unknown. (G. A. Ro.)

Pliofilm: see INDUSTRIAL RESEARCH; RUBBER AND RUBBER MANUFACTURE.

Plums and Prunes. Large crops and marketing difficulties, because of the European war, caused the Yugoslavian Government to take over prune exports in 1939 and to guarantee a minimum price to plum and prune growers. In Bulgaria 6,000,000kg. of prune pulp, a newly-developed product for export, were shipped to Germany. The Bulgarian crop was estimated at about 130,000,000kg. compared to 96,000,000kg. in 1938. In New Zealand, which exports about 2,500,000lb. of prunes annually, experiment was begun with a plantation of 500 trees of new variety. In the United States a

part of the 1939 crop of prunes was left on the trees because of low prices. The plum crop in the United States in 1939 was reported by the Department of Agriculture as 75,300 tons, compared to 65,900 tons in 1938 and a ten-year (1928-37) average of 67,590 tons. By States the plum crop was, in tons:

	1939	1938	10-yr. average
California	69,000	63,000	61,800
Michigan	6,300	2,900	5,790

The prune crop in the United States in 1939, in 1938 and for the ten-year (1928-37) average was, by States, in tons, as follows:

PRUNES DRIED			
	1939	1938	10-yr. average
United States	212,400	238,300	225,300
California	184,000	224,000	198,600
Oregon	26,600	13,300	23,460
Washington	1,800	1,000	3,440
PRUNES USED FRESH			
	1939	1938	10-yr. average
United States	54,900	48,500	49,350
Idaho	20,200	15,200	18,110
Oregon	19,400	17,800	17,000
Washington	15,300	15,500	14,240
PRUNES CANNED			
	1939	1938	10-yr. average
United States	31,500	15,500	18,460
Oregon	25,600	12,400	13,940

(S. O. R.)

Pneumonia. The year 1939 stands out as a banner year in the history of the control of pneumonia. Interest has been focused chiefly on the therapeutic use of the new derivative from sulphanilamide, sulphapyridine. The chemical formula of this agent is 2-(p-aminobenzene-sulphonamide) pyridine; it was originally produced in England in 1938 under the trade name of M&B 693. One of the most interesting features of sulphapyridine is its applicability to all types of pneumococci, and it appears to be just as efficient against the streptococcus haemolyticus as sulphanilamide itself. Some authors claim that certain strains of pneumococcus may develop a tolerance to the drug, but from the standpoint of practical experience, this must be an extremely rare occurrence. There is still some debate as to which of the two agents, sulphanilamide or sulphapyridine, is the less toxic. No doubt further studies will supply a definite answer to this question, but for the present it is safe to say that there is not a great deal of difference in their toxicity for man.

Sulphapyridine is less readily and more irregularly absorbed in man than is sulphanilamide, and furthermore, a considerable inactive fraction accumulates in the blood in the form of conjugated or acetylated sulphapyridine. Due to this fact, it is impossible to foretell from the amount of the drug administered the resulting blood level of the active unbound drug. It may vary widely, due to the difference in the amount of drug conjugation in different subjects. Often extremely high blood levels will be obtained with apparently small doses of the drug, and conversely a clinical response may be obtained with blood levels of only 1 to 2 mgms. per cent. The ideal blood level has not yet been established, but it is probably somewhere between 5 and 10 mgms. per 100c.c. of blood.

The effect of sulphapyridine on the clinical course of pneumonia is usually prompt and dramatic. Within a few hours after the initial dose, the temperature may drop to normal by crisis and the patient seems much more comfortable, though there may be some nausea and depression resulting from the drug. With the drop in temperature, there is a corresponding fall in pulse and respiration.

The toxic effects of sulphapyridine are varied. Most common of these is nausea and vomiting. Other less frequent complications are a rapid fall in the total number of red or white corpuscles in the blood, mental depression, fever, and drug rashes. Occasionally the drug precipitates in the urinary tract to form stony concretions.

The statistical reports on the effect of sulphapyridine on the fatality rate of pneumonia show an amazing drop from a standard death rate of 25% to 30% in patients who have not received specific treatment to a figure between 5% and 10% for patients treated with sulphapyridine.

The writer compiled from the American literature 956 cases of pneumococcal pneumonia treated with sulphapyridine. The death rate for this entire series was only 7.1%.

Favourable reports continue to appear on the value of concentrated rabbit serum in the treatment of pneumonia. For example, C. M. McLeod reports 100 pneumonia patients treated with specific rabbit serum, of whom only eleven died.

Of these eleven, however, seven deaths were due to Type III pneumococcus, a type for which the most ardent advocates of serum therapy have never made many claims. It seems quite clear that with the refined rabbit serum now in use, the results obtained are quite as good as those which result from chemotherapy, Type III cases of course being excluded.

A practising physician now has a double-barrelled weapon for fighting pneumonia. For many reasons chemotherapy is preferable to serum therapy because of its simplicity of administration by mouth and because it is effective in all types of pneumonia. However, there are still 5% to 10% of patients who die in spite of sulphapyridine, and many authorities believe that when sulphapyridine fails to give prompt results, the treatment should be supplemented by specific serum therapy. They believe that for both theoretical and practical reasons, all pneumonia patients with bacteria in the blood-stream should receive both agents. The writer is quite sympathetic with such a point of view. It seems quite possible, however, that as we become more skilful in the use of chemotherapy, there will be less and less need for serum therapy.

Finally, there are certain patients who, because of drug idiosyncrasy cannot take sulphapyridine. Specific serum should be used in such cases.

In addition to these important advances in the field of specific therapy, some progress is also being made in oxygen therapy. Efforts are now being made to simplify oxygen therapy and to get away from the complicated and expensive oxygen chambers and oxygen tents. As a substitute for elaborate methods, several types of nasal inhalators have been introduced and the face masks of Barach and of Boothby have also attracted attention. These simplified methods, however, all have certain disadvantages; it seems quite likely that the oxygen tent will continue to be the favourite method of administering oxygen for some time to come. Fortunately, with our greatly improved specific therapy, there will be less and less demand for oxygen therapy. (See also CHEMOTHERAPY; EPIDEMICS AND PUBLIC HEALTH CONTROL; MEDICINE; SERUM THERAPY.)

Poland. Area (Sept. 1, 1939) c. 150,820 sq.mi.; population (est. Jan. 1, 1939) 34,900,000; (Sept. 1, 1939) c. 34,200,000. Chief towns (pop. est. Sept. 1, 1939): Warsaw (1,300,000), Lodz (690,000), Lwow (350,000), Poznan (290,000), Cracow (280,000), Vilna (225,000). President (Jan. 1, 1939): Prof. Ignacy Mościcki; (Sept. 30, 1939): Wladislaw Raczewicz; Premier (Jan. 1, 1939): Gen. Slawoj Skladkowski; (Sept. 30, 1939): Gen. Wladislaw Sikorski.

History.—The year 1939 marks the end of Polish independence, created by the Versailles Treaty in 1919. Nazi-Germany attacked Poland on Sept. 1, 1939 and, by that act, started the European war (*q.v.*). Great sections of the country, and especially the great cities like Warsaw, Lodz and Lwow, were severely damaged by constant bombardment during Sept. 1939.

International Relations.—Since 1934, and the conclusion of a non-aggression treaty with Germany, Poland's foreign policy tried to maintain a balance between the country's two powerful neighbours, Germany and Soviet Russia. On Jan. 25, 1939, Joachim von Ribbentrop, Nazi Foreign Minister, visited Poland for the celebration of the fifth anniversary of the Polish-German non-aggression treaty. The document was praised by him as one of the fundamental instruments of European peace, and as the basis for friendly Polish-German relations. In fact, the Polish foreign policy, under Colonel Beck, was considered, by a large section of public opinion in the democratic countries, as being pro-German.

When the Nazi Government, after the annexation of Czecho-Slovakia, made demands on Poland for the cession of Danzig, and for an ex-territorial road through Pomorze, the opposition in Poland, irrespective of party affiliations, was unanimous. Poland feared the fate of Czecho-Slovakia, and refused to abandon its sovereignty over any section of her territory. The Polish Government was willing to negotiate, and establish a common Polish-German guarantee over Danzig, and make all possible concessions to facilitate German transportations through Pomorze. This meant that Poland was willing to agree to a virtual political Anschluss between Danzig and the Reich, while reserving her vital economic interests in the Baltic. When no reply was received to these proposals, Poland realized the gravity of the danger and turned towards Great Britain and France. Meanwhile, the British Government, shocked by Chancellor Hitler's violation of the Munich agreement, decided upon a fundamental change in British foreign policy. In a historic statement in the House of Commons, on March 31, 1939, Prime Minister Chamberlain gave assurances to Poland that:

... in the event of any action which clearly threatened Polish independence and which the Polish Government, accordingly, considered as vital to resist with their national forces, His Majesty's Government would feel themselves bound at once to lend the Polish Government all support in their power. They have given the Polish Government an assurance to that effect. I may add that the French Government have authorized to make it plain that they stand in the same position as do His Majesty's Government.

The unilateral guarantee of the British Government was subsequently changed into a bi-lateral treaty of mutual assistance.

Chancellor Hitler, in his speech of April 28, 1939, before the Reichstag, denounced the non-aggression treaty with Poland of 1934, and in a memorandum sent the same day by the German Government to Poland, it was explained that the denunciation of the non-aggression treaty was the result of Poland's acceptance of the British guarantee. Colonel Beck, replying to the German demands, reaffirmed the willingness of Poland to negotiate over the Danzig and Pomorze questions, and denied that the British guarantee of Polish independence was in contradiction with the non-aggression treaty between Poland and Germany.

Incidents in Danzig and on the Polish-German frontier were multiplying during the summer 1939, and an anti-Polish press campaign was launched in the German newspapers. When, on Aug. 19, 1939, a commercial agreement was signed between Nazi-Ger-

A GERMAN INCENDIARY BOMB fired these suburban homes of Warsaw in Sept. 1939 and killed 15 occupants

many and Soviet Russia, followed by a non-aggression pact, Germany was pressing for an immediate solution of her difficulties with Poland. Chancellor Hitler agreed, through Sir Nevile Henderson, British Ambassador in Berlin, to enter into direct negotiations with Poland, if a Polish envoy with full powers would come to Berlin. Poland refused to negotiate on those conditions, and insisted that talks be held in a neutral country. The Polish Government, remembering the so-called negotiations between Schuschnigg or Hacha, and the German officials, in similar conditions, declared that no envoy who would have to sign on the dotted line would go to Berlin.

On August 31 at 9 P.M., an official communication was read over the German radio, stating that the German Government had waited in vain for two days, for the arrival of a Polish negotiator. In these circumstances, "the German Government cannot but regard their proposals as having been virtually rejected." Those proposals contained the demand for the return of Danzig to the Reich. In Pomorze, a committee composed of representatives of Great Britain, France, Soviet Russia, and Italy, was to organize a plebiscite limited to those domiciled in the territory on Jan. 1, 1918. In the event that the Corridor went to the Reich, under the plebiscite, Poland was to receive a narrow corridor connecting her to Gdynia. If Poland won the plebiscite, Germany was to get an ex-territorial road and a four-track railway line. The German proposals provided also for compensation of damages done to minorities since 1918, and for the demobilization of Danzig, Gdynia, and the peninsula of Hel. On Sept. 1, 1939, German troops crossed the frontier and a score of cities, including Warsaw, Lwow and Cracow, were bombed.

Partition of Poland: Premier Molotov, in a radio speech of Sept. 17, 1939, declared that the Polish State ceased to exist and therefore the treaties concluded between the Soviet Union and Poland, namely the non-aggression treaty of 1932, had lost all value. The Soviet Union could not "remain indifferent to the fate of its blood-brothers," the Ukrainians and White Russians. At least 1,000,000 Soviet troops marched into Poland, and met

with practically no resistance. On September 28, an agreement was signed in Moscow, between Germany and the Soviet Union, dividing Poland between the two countries.

German-occupied territory: The area is about half of the territory of the former Polish republic; is inhabited by about 21,000,000 people, of which 18,000,000 are Poles, less than 2,000,000 Jews, and about 800,000 are Germans. Contains the most important industrial establishments and large agricultural areas in the provinces of Posen and Pomorze. Culturally, the people are much more advanced than in the Russian-occupied area. Most of the large cities of Poland are situated here. German authorities have divided the territory into two sections; one, containing the provinces of Pomorze, Posen, and Upper-Silesia (which, before 1914 belonged to the German Empire), and Lodz, was incorporated in the Reich; the other, with Cracow as its capital, was made into a Gouvernement General of Poland.

Russian-occupied territory: An area of about 75,000 sq.mi., inhabited by approximately 13,000,000 people, of which 8,000,000 are Ukrainians and White Russians, 1,300,000 are Jews, and 3,500,000 are Poles; contains oil wells in Galicia, and textile industry in Bialystok; the population is overwhelmingly agricultural and very poor. Only one great city, Lwow.

In an agreement between Soviet Russia and Lithuania, the city and region of Vilna were ceded to the Lithuanian republic.

New Regime: On Sept. 30, 1939, President Mościcki resigned and appointed as his successor Wladislaw Racziewicz. The new President appointed, in Paris, a Cabinet, composed of representatives of all important Polish political parties, and headed by General Wladislaw Sikorski. The new Polish Government later moved to Angers (France), and was recognized, not only by the Allies, but also by the neutrals. The program of the Government is the establishment of a new democratic Poland, in which all citizens will be granted equality of rights. (See also ANTI-SEMITISM; CZECHO-SLOVAKIA; MINORITIES; SLOVAKIA.)

Police. The numerical strength of municipal police in the U.S. continues to increase. Latest figures (for 1938) covering over 2,500 cities, towns and villages, are summarized from the *Uniform Crime Reports* in Table I.

All five groups of cities above 10,000 population showed a slight increase in police quotas for 1938 over 1937. Any increase in police quotas is immediately reflected in police costs. Latest

data upon per capita costs for police are shown in Table II which is complete for all cities over 50,000 population.

Police pay-scales also continued to rise, as the salary cuts effected during the early 1930s were gradually restored to former levels.

Table I

Population Groups	Number of Forces Filing Returns	Number of Police per Thousand of Population
Group I—over 250,000	37	2.2
Group II—100,000 to 250,000	57	1.5
Group III—50,000 to 100,000	102	1.4
Group IV—25,000 to 50,000	190	1.2
Group V—10,000 to 25,000	571	1.1
Group VI—2,500 to 10,000	1,581	1.1
Totals	2,538	1.6

Table II

Population Groups	Per Capita Cost of Police—\$				
	1936	1935	1934	1933	1932
Group I—All cities over 250,000 pop.	6.06	5.84	5.65	5.69	6.06
Group II—All cities from 100,000 to 250,000 pop.	3.71	3.65	3.60	3.79	4.35
Group III—All cities from 50,000 to 100,000 pop.	2.83	2.71	2.66	2.69	3.00

New York, Jersey City, Yonkers and Mount Vernon (all located in the New York metropolitan area) continued to have the highest pay-scales, with the maximum pay for the grade of patrolman set at \$3,000 per annum in these four cities. Generally speaking, police salaries are highest in the larger cities, and lower in smaller places. From the standpoint of geographic distribution, the higher brackets are to be found in the Middle Atlantic, New England and Pacific Coast States, and along the Great Lakes, while the lowest police scales are quite definitely located in the South Atlantic and South Central areas. Thus, the level of police salaries reflects in a general way the local living costs and standards.

The latest available figures for crimes cleared (by arrest and formal charge) relate to the calendar year 1938. As in previous years, the largest percentage of offences cleared in this manner was in the group of reportable crimes against the person (murder, manslaughter, aggravated assault and rape), which ranged, in 1938, from 77.3% (for aggravated assault) up to 89.5% (for murder and non-negligent manslaughter). Crimes against property show a less favourable situation, with clearances in 1938 ranging from 22.3% (for auto theft) up to 42.5% (for robbery). The police record of crime clearances for 1938 was in general better than that for 1937, except as to larceny and rape.

Taking the country as a whole, success in solving crimes varies inversely with the size of the city, and 1938 was no exception to the general rule. It should not, however, be concluded that there is any causal relationship between the two, the whole issue being confused by the fact that both the crime rates and the police quotas of the small cities are smaller than those of the large cities. A summary of the 1938 percentage of clearances, for 1,182 cities, towns and villages with a total population of 38,462,850, appears in Table III.

England and Wales.—Increase in the numerical strength and the net cost of the police forces, noted for each year since 1934-35, was continued in 1938. The totals for recent years are shown in Table IV.

The numerical strength of the London Metropolitan Police

Table III

	Murder and Non-Negligent Manslaughter	Negligent Manslaughter	Rape	Robbery	Aggravated Assault	Burglary, Breaking or Entering	Larceny, Theft	Auto Theft
Offences Cleared by Arrest	89.5	87.1	82.5	42.5	77.3	34.7	25.3	22.3

Table IV

	Numerical Strength	Gross Expenditure
1938	63,504	£25,849,470
1937	62,804	25,096,020
1936	60,966	23,497,839
1935	60,257	22,751,377
1934	59,988	22,785,323

totalled 18,623 in 1938, which represented a decline of 263 from the preceding year. Prior to that, the force had reached levels which approached 20,000 men. The annual report of Lieutenant Colonel Frank Brook, H.M. Inspector of Constabulary, caused wide comment in police circles, particularly the statement that "the time is appropriate for a renewed plea for the merging of small forces. . . . Some of the forces are too small to justify the police administration, and cannot procure even simple police equipment. . . . The time has gone by when the Service as a whole can be handicapped by local sentiment."

As a result of a vigorously conducted Home Office experiment in the maintenance of road patrols, the Lancashire constabulary showed a 44% reduction, in 1939, in personal injury road accidents. Recruiting difficulties continued in 1939, particularly in the Metropolitan police force. Air raid precautions, for the administration of which the police have been made largely responsible during recent years, became a duty of prime importance with the outbreak of the European war on Sept. 1, 1939. At about the same time, the police were armed with revolvers, which represented a departure from established practices of long standing. Extension of regional crime laboratories by the Home Office was continued during 1938 with the establishment of the Northwestern Forensic Science Laboratory at Preston. It will serve every police force in Lancashire, Cumberland and Westmoreland.

Police reported a general increase in indictable offences during 1938 (running as high as 109% in Canterbury), and juvenile offences also gave cause for concern. On the other hand, non-indictable offences showed a tendency to decline.

Scotland.—Continued rise in police quotas and in police costs was a feature in 1938. A comparison for recent years follows:

	Numerical Strength	Net Expenditure
1938	6,887	£2,563,523
1937	6,695	2,426,439
1936	6,607	2,397,246
1935	6,556	2,296,943

Further consolidation of small police forces, long agitated in the United Kingdom, was proposed by the Scottish Office to the county councils of Wigtown, Kirkcudbright and Dumfries. Similar action was suggested with respect to the Angus constabulary and the Arbroath Burgh police.

At Comaig, on the Island of Tiree, a new police station, with electrically heated cells, was opened in 1939. Value of the new facilities was doubted by those who pointed out that no prisoners have been taken on either Tiree or Coll within the memory of persons now living.

General.—The first Congress International de Criminalistique was held in Lausanne, July 22-24, 1938. Technical papers on various aspects of police science were read by delegates from Frankfurt-am-Main, Lausanne, New York, Riga, Karlsruhe, Lille, Graz, Stockholm, Genoa, Assen, Berne, Budapest, Tallinn, Amsterdam and Berlin. In Canada, the 34th annual convention of the Chief Constables' Association was held at Windsor, Ontario, in June 1939. Greatest interest centred around a proposal that Canadian police be co-ordinated as in the United Kingdom, with the Dominion establishing standards for and contributing to the support of a system of locally controlled forces. Compulsory civil finger-printing was also discussed.

In Oct. 1939, the International Association of Chiefs of Police (in which American and Canadian memberships heavily predomi-

nate) held its 46th annual Police Congress at San Francisco. Most important action there taken involved renewed efforts to secure more adequate frequencies for police radio service, and a report by a special committee that "the residence restrictions imposed in many communities which prohibit trained, qualified and experienced persons from competing in examinations (for police appointment), simply because they do not reside within the corporate limits of the city in which examinations are being conducted, is the greatest handicap to professionalized police service."

During 1939, also, the Federal Bureau of Investigation at Washington announced the opening of the new National Police Training Center at Quantico, Virginia. Hailed as a veritable "West Point of Law Enforcement," the new plant and improved facilities will be devoted to the higher training of Federal, State and local police officers.

Important publications of the year included the *Police Blue Book*, 1939-40 (International Association of Chiefs of Police), a directory of the major police officials of 70 countries, dominions, colonies, dependencies and mandated territories, together with those of the States, provinces and leading civil subdivisions. (See also FEDERAL BUREAU OF INVESTIGATION.)

Polo. The first international polo between Great Britain and the United States to take place in the U.S.A. since 1930, and the first to be held anywhere since 1936, was the outstanding event of 1939 in polo. In this two-out-of-three game series for the historic International Polo Challenge Cup, held at the Meadow Brook Club in June, the United States team successfully defended the Cup by winning two straight games by the scores of 11 to 7 and 9 to 4. The United States team consisted of Michael G. Phipps, Thomas Hitchcock, Jr., Stewart B. Iglehart, and Winston F. C. Guest. Great Britain played with Robert Skene, Aidan Roark, Gerald Balding, and Eric H. Tyrrell-Martin.

The National Open championship, top event of the American season, was won by the Bostwick Field team of George H. Bostwick, Robert L. Gerry, Jr., Elbridge T. Gerry, and Eric H. Tyrrell-Martin. They defeated the Greentree team of J. Peter Grace, Jr., Robert Skene, Thomas Hitchcock, Jr., and John Hay Whitney in the final game. Greentree, however, was successful in capturing the Monty Waterbury Memorial Cup, the most important handicap tournament of the year. (R. F. K.)

Pond, Irving Kane (1857-1939), U.S. architect, was born May 1 at Ann Arbor, Mich. and was educated at the University of Michigan there. After travelling abroad in 1883-84 he settled in Chicago, where he established an architectural firm with his brother, Allen B. Pond. Among the buildings designed by this firm were the Hull House and the Chicago Commons in Chicago, the Michigan Union building at the University of Michigan, and a public hospital at St. John, N.B., Canada. He died at Washington, D.C., September 29.

Pope, Sir William Jackson (1870-1939), British chemist. Born at London on March 31, he was educated at Finsbury Technical college and Central Technical college, London. In 1901 he became professor of chemistry at the Municipal School of Technology at Manches-

ter, and in 1908 he was appointed professor of chemistry at Cambridge. His first research was in crystallography. Later he specialized in pure organic chemistry, and during the World War he made notable discoveries in connection with mustard gas and other poison gases. For his career and work consult *Encyclopædia Britannica*, vol. 18, p. 226, also the index. Sir William died at Cambridge on October 17.

Popular Front: see COMMUNISM; LABOUR PARTY.

Populations of the Countries of the World: see AREAS AND POPULATIONS OF THE COUNTRIES OF THE WORLD.

Porto Rico: see PUERTO RICO.

Portugal, area (including Azores and Madeira) 35,670 sq.mi.; pop. (est. Dec. 31, 1938) 7,460,000. Chief towns: Lisbon, capital, 594,300; Oporto, 232,280. President: Gen. António Carmona; language: Portuguese; religion: Christian (mainly Roman Catholic).

History.—Internally, Portugal in 1939 was passing through a period of reorganization conducive to greater efficiency in the public services. The Foreign Office and the Board of Trade were entirely reconstructed and the reform of the postal, telegraph and telephone services, begun in 1937, was completed. The contract was given for a new naval base to be constructed in Lisbon at a cost of £130,000. The outstanding spectacular event of the year was the February rally, in Lisbon, of 300,000 members of labour syndicates in honour of Dr. Salazar. Preparations for the commemoration, from May to Dec. 1940, of the two great anniversaries, that of the independence of Portugal and that of Portugal's final separation from Spain, continue.

The treaty of non-aggression and friendship signed with Spain on March 17, 1939 confirmed and intensified the good relations existing between the two corporative States.

On May 22, in the National Assembly, Dr. Salazar made a formal declaration that the Anglo-Portuguese alliance continued to be an unchanging principle of Portuguese policy, and the House of Commons, four days later, was informed that "His Majesty's Government for their part unhesitatingly reaffirm their determination to fulfil their obligations under this alliance."

On the outbreak of the European war, the Portuguese Government issued a manifesto, declaring its neutrality and confirming the alliance with Britain. In October, Dr. Salazar made a declaration, in this sense, before the National Assembly. On the commercial side it seems likely that Britain will recover much lost trade with Portugal. Being far from Germany, Portugal has been little affected by the war, but early in September a decree to check speculation was issued which provides for the control of imports, exports, and industrial and commercial activities, and, if necessary, the requisition of retailers' establishments and the rationing of food. (E. A. P.)

Education.—Elementary (1937) schools 7,890; scholars 734,922; secondary (1936-37) schools 45; scholars 18,055; universities (1936-37) 3; students 5,871.

Banking and Finance.—Revenue, ordinary (est. 1939) 2,029,200,000 escudos; expenditure, ordinary (est. 1939) 2,019,800,000 escudos; public debt (1938) 7,229,300,000 escudos; notes in circulation (Aug. 31, 1939) 2,230,000,000 escudos; gold reserve (Aug. 31, 1939) 920,000,000 escudos; exchange rate: 110 escudos = £1 sterling.

Trade and Communications.—External trade (merchandise): imports (1938) 2,284,337,000 escudos; (Jan.-Aug. 1939) 1,275,720,000 escudos; exports (1938) 1,140,943,000 escudos; (Jan.-Aug. 1939) 786,770,000 escudos; re-exports (1938) 412,436,000 escudos. Communications and transport (Dec. 31, 1937): roads, first and second class 8,858 mi.; railways, open to traffic 2,187 mi.;

motor vehicles licensed: cars 34,442; commercial 11,410; cycles 4,536; shipping (June 30, 1938) 261,100 gross tons; launched (July 1938–June 1939) 2,100 gross tons.

Agriculture and Minerals.—Production 1938 (in metric tons): wheat 430,100; maize 296,200; wine 10,955,000 hectolitres; coal 308,000; rye 102,900; oats 94,800; rice (1937) 84,900; barley 39,000; potatoes (1937) 596,100; olive oil 36,000; sea fisheries 224,400. (W. H. WN.)

Post Office. The estimated revenues of the Post Office Department for the fiscal year ended June 30, 1939, amounted to \$745,955,075.24, which was the largest in the history of the service, exceeding by \$17,321,023.88 the previous banner year of 1938, an increase of 2.38%.

The audited expenditures for the department during the fiscal year were \$784,646,938.14, leaving a gross deficit which includes various non-postal items such as franked mail, air mail subsidy, penalty mail, and publications free in county, of \$38,691,862.90. Deducting all these non-postal items which total \$55,374,890.27, as authorized by Act of June 9, 1930, leaves a net postal surplus for services rendered for hire of \$16,683,027.37. This was the fifth net postal surplus during the past six years.

In addition to its customary functions the Post Office Depart-

ment has performed many other important public duties, including the sale of United States savings bonds, which during the fiscal year ended June 30, 1939, amounted to \$567,007,406.25.

Air Mail.—During the year 1939 both domestic and foreign air mail services showed tremendous growth. At the end of the fiscal year the aggregate length of all domestic air mail routes was 37,049mi., representing an increase of approximately 3,394mi. during the period. A total of 15,818,617,372 pound-miles of air mail service was performed as compared to 14,137,360,791 pound-miles during the fiscal year 1938. The revenues during the same period were \$16,326,358.27, an increase of 6.7% over the previous year. Within the fiscal year service was inaugurated on six new domestic routes as follows: Phoenix, Arizona to Las Vegas, Nevada; Jacksonville, Fla. to New Orleans, La.; Tampa, Fla. to Memphis, Tenn., and Tallahassee, Fla. to Atlanta, Ga.; Detroit, Mich. to Sault Sainte Marie, Mich.; Houston, Tex. to Brownsville, Tex. and San Antonio Tex.; Wichita, Kan. to Pueblo, Colo.

There was a substantial increase in the amount of mails trans-

ported over foreign routes, amounting to 22.1% in mails dispatched and 19.3% in mails received. There are now 34,302.6 route miles embraced in the foreign air mail service over which 5,357,405.1mi. were flown during the fiscal year.

An important event of the year was the inauguration of transatlantic air mail service. Twice a week service was authorized on the southern route between New York and Lisbon, Portugal, and on the northern route between New York and Foynes, Ireland.

The United States Foreign Air Mail System now serves directly 93 cities in the following places: Canada, Newfoundland, Europe, Cuba, Mexico, Central and South America, Hawaii, Asia, as well as Alaska, the Philippine Islands, Puerto Rico, the Canal Zone and Guam.

Buildings.—During the fiscal year 1939, 160 new and additional Federal buildings were occupied, 13 extensions to existing buildings completed, and 16 new Federal buildings replaced a like number of old buildings which had become inadequate for Government purpose.

Nearly 400,000 people earn their living in the postal service,

AN AUTOGIRO AIR-MAIL ROUTE—first in the world—was inaugurated July 6, 1939, to deliver mail to the Philadelphia post office from Camden airport, six miles away

of which something more than 250,000 are regularly employed. (See also GOVERNMENT DEPARTMENTS AND BUREAUS.)

(J. W. Co.)

Great Britain.—The increase in the work of the British Post Office was well maintained during the year ended March 31, 1939. The delivery of letters and parcels both showed new records, the former at 8,150,000,000 (up 160,000,000 on 1938), the latter at 184,832,000 (up 9,332,000). The issue of money orders rose to 17,155,000 (up 312,000), representing a sum of £70,984,000 (up £1,483,000), while the sale of postal orders again registered a big increase, the number rising by 23,196,000 to 422,427,000, and the amount by £4,057,000 to £103,960,000—figures that again reflect the activities of the football pool promoters.

The increase in telephones—nearly 185,500, bringing the total to 3,235,500—was rather smaller than that of the previous year; effective calls totalled 2,236,000,000 (up 70,000,000) of which 2,122,400,000 were local and 111,553,000 inland trunk calls, the remainder being international. Telegrams, which had shown a fall the previous year, rose by 929,000 to 59,311,000, of which 50,396,000 were inland; the "greetings" telegrams no doubt contributed to this result, for at 4,500,000 they showed an increase of 33%.

The Post Office surplus declined by £629,942 to £9,539,588, making it necessary to withdraw £990,894 from the reserve to enable the fixed exchequer contribution to be met. Net receipts during the year were £88,452,687. The issue of a further £40,000,000 capital for development of the service was authorized by parliament in July, when it was estimated that £36,200,000 would be required for the telephone and £3,800,000 for the postal and telegraph services to cover the period ending about March 1941.

On the outbreak of war a certain amount of increased charges and curtailment or restriction of services became necessary, particularly in relation to overseas air-mails; and it is to be regretted that what was to have been a regular weekly transatlantic air-mail service had to be abandoned. It was inaugurated on June 28 by the arrival at Southampton of the Pan American Airways' flying-boat "Yankee Clipper," with 1,734 lb. of mail, and the arrival at New York on Aug. 7 of the Imperial Airways' "Caribou" with 960 pounds.

During the year newly designed stamps of the values of 9d., 10d., 1s., 2s.6d., 5s., 10s., were issued. (See PHILATELY.)

(L. H. D.)

Potash.

The crude potassium salts output of the world is almost exclusively the chloride or sulphate, with a small proportion of nitrate and carbonate, produced primarily for fertilizer use; only a very small amount goes into industrial chemicals, and even in the United States, where the industrial demand is probably higher than in any other country, with the possible exception of Germany, the chemical salts comprise only about

10% of the total. World production decreased from 2,800,000 metric tons of K_2O equivalent in 1929 to 1,400,000 tons in 1932, increasing to 3,105,000 tons in 1938, distributed as follows: Germany 60%, France 19%, United States 9%, Soviet Union 9%, and Poland 2%; the remaining 1% comes from Palestine, Spain and several still smaller sources.

The production of potash in the United States was a World War development that has been growing steadily since the post-War slump. In 1929, five plants produced 55,900 tons, and expansion continued throughout the depression with practically no break; 10 plants produced 174,900 tons in 1935, and nine plants turned out 287,500 tons in 1938. In spite of this heavy increase in production the demand far exceeds the supply, and imports increased to 219,000 tons in 1935 and 318,000 tons in 1937, but decreased to 175,600 tons in 1938. Sales of potash salts in the United States in 1938 amounted to 869,300 metric tons, equivalent to 424,100 tons of K_2O . (See also FERTILIZERS.)

(G. A. Ro.)

Potato Beetle: see ENTOMOLOGY.

Potatoes.

Prices for potato starch advanced sharply in Aroostook county, Maine, centre of the United States potato starch industry, following the outbreak of war which prevented exports of starch from Germany, a large producer of potatoes and starch. The *Potato World* reported that Aroostook factory prices had advanced from 3½¢ in June to 6¢ a pound in October. The war demand for sand bags caused a rise in the price of bags used in sacking potatoes. An innovation in the potato trade also developed in 1939 when the Chicago Mercantile Exchange established futures trading in potatoes, similar to futures trading in grain, cotton and other commodities. Production in the United States in 1939 was given by the Department of Agriculture in preliminary reports as 358,689,000 bu., or 3% under the 1938 crop of

U.S. Production of Potatoes by States, 1938 and 1939

371,617,000bu. and 4% under the ten-year average (1928-37) of 372,258,000. Canadian official estimates placed the 1939 crop at 38,875,000cwt., compared to 35,938,000cwt. in 1938 and nearly 6% under the six-year average. Other important producing countries showed the 1939 crop as follows, with 1938 figures in parentheses: Netherlands 93,695,000bu. (103,632,000); Hungary 86,346,000bu. (78,653,000); Finland 56,584,000bu. (44,014,000); Estonia 33,730,000bu. (36,656,000); Switzerland 24,985,000bu. (29,802,000); Italy 12,066,000bu. (13,358,000). Figures for Poland, Germany, France and England and Wales are not available, but official reports of the acreage planted to potatoes in 1939 and 1938 are: Germany 7,848,000ac. (8,046,000), including Austria and the Sudeten; Poland 7,562,000ac. (7,487,000); France 3,415,000ac. (3,521,000); England and Wales 454,000ac. (475,000). The German crop in 1938 was 1,964,430,000bu.; England and Wales 123,797,000 bushels. (See also SWEET POTATOES.)

(S. O. R.)

Poultry.

The largest production on record, both in chickens and turkeys, was reported in 1939 in the United States. Between January 1 and July 31 commercial hatcheries hatched 19% more chicks than the previous high of 1936. Increased production is a continuation of the shift from home hatching to commercial hatcheries as the source for chicks to supply both commercial and farm flocks. Since records of commercial hatcheries were first available in 1929 production of chickens has moved invariably in a three-year cycle, one year down and two years up. Production was on the increase in both 1938 and 1939. Therefore, the Department of Agriculture anticipates a probable decrease in production in 1940. Farm flocks in 1939 were about 2% larger than in 1938. There are about 400,000,000 laying hens in the United States, according to the Institute of American Poultry Industries, which estimates that breeder hatcheries and commercial hatcheries produce about 700,000,000 chicks annually. In Canada the number of chickens on farms, as of June 1, was officially reported as 58,509,800 in 1939 and 53,774,600 in 1938; turkeys, 2,476,000 in 1939 and 2,039,600 in 1938. In England and Wales on the same dates, chickens 52,738,000 in 1939 and 52,539,000 in 1938; turkeys 700,000 in 1939 and 789,000 in 1938. In Scotland, chickens 7,293,700 in 1939 and 7,380,900 in 1938; turkeys 131,100 in 1939 and 145,900 in 1938. Prices for chickens ruled lower in the United States in 1939, as, for example, in Nov. 1939, farmers received an average of 12.4¢ a pound compared to 13.6¢ a year earlier. The proportionate increase in supplies in 1939 over 1938 is indicated by stocks of frozen poultry of 81,165,000lb. Nov. 25, 1939, compared to 76,481,000lb. a year earlier. War had no effect on poultry prices in the United States, except as it may affect public buying power. During the World War (1914-18) poultry exports provided only about 1½% of the total income United States farmers received from poultry. Despite record supplies turkey prices in the United States in 1939 approximated those of 1938, owing to the fact that growers are encouraging all-winter consumption of turkeys, and not merely holiday consumption. Observance of Thanksgiving on both November 23 and November 30 by different communities in 1939 added to the demand for turkeys. (See also EGGS.)

(S. O. R.)

Pound, Sir (Alfred) Dudley (Pickman) Rogers

(1877-), British First Sea Lord, was born August 29 and was educated at Fonthill, East Grinstead, and at The Limes, Greenwich. He was in command of H.M.S. "Colossus" at the Battle of Jutland May 31, 1916, and was mentioned in dispatches for his part in the engagement. From 1922 to 1925 he was director of the Admiralty's plans division, and from 1925 to 1927 chief of staff to

Admiral Sir Roger Keyes, then commander-in-chief of the Mediterranean fleet. After two years as assistant chief of the Naval staff (1927-29) and two years as rear admiral in command of a battle cruiser squadron (1929-31), he was appointed in 1932 as Second Sea Lord and chief of naval personnel at the Admiralty. He was advanced to admiral in 1935 and the next year he was named commander-in-chief of the Mediterranean fleet. On May 17, 1939, he was appointed First Sea Lord and chief of the British naval staff to succeed Admiral Sir Roger Backhouse (q.v.).

Presbyterian Church.

The Reformed Churches holding the Presbyterian System, located within the U.S.A., are twelve in number and include 18,054 ministers, 18,581 churches, and 3,984,732 communicant members. Outside of continental United States, they have 2,221 American foreign missionaries and 12,800 native workers in a total of 21 countries, and a communicant membership of 239,258.

The year 1939 among the Churches of the Presbyterian family was marked by an increased emphasis upon the evangelistic program. There was no attempt to evade or under-rate disquieting features of church life, yet every effort in church activities indicates a turn in the tide which is most heartening. Several of the larger denominations reported the greatest net increases in church membership in the last ten years.

A world aspect was given to the spirit of church unity when the General Assembly of the Presbyterian Church in the United States of America elected as its Moderator, Dr. Sam Higginbottom, a British citizen, president of Allahabad Christian college, and one of the most widely known missionaries in the world. In addition, that body received with marked approval reports from its Department of Church Cooperation and Union regarding the negotiations in 1939 with the Protestant Episcopal Church and the Southern Presbyterian Church. Invitations were issued to the Reformed Church in America and to the United Presbyterian Church to confer upon closer co-operation, and a message was received from the Methodist Commission on Interdenominational Relations inviting the General Assembly to resume the negotiations toward union interrupted pending completion of union of the three leading Methodist churches in the United States.

Plans were carefully made for the first General Synod of the newly created Evangelical and Reformed Church to be held in June 1940. These plans, necessitated by the union consummated in 1938, include the mode of operation, and the scope of activity of congregations (officers and members), synods, boards, educational and benevolent institutions and commissions.

Eleven changes in the Confession of Faith of the Presbyterian Church in the United States (Southern) were finally approved, a number of others proposed being rejected. Two overtures which would revise the Confession of Faith and the Larger Catechism of the Presbyterian Church in the United States of America to make more clear the Christian right of conscientious objection to military service in the event of war, received the approval by a majority of the presbyteries, but failed of the required approval of two-thirds of the presbyteries. This vote should not be regarded as indicating the attitude of this Church toward war itself. A meeting of real significance in the relation of the Presbyterian and Reformed churches to the Oecumenical Movement was that of the Western Section of the World Presbyterian Alliance in Feb. 1939.

Europe.—In spite of the outbreak of war, the year 1939 among the Presbyterian Churches of Great Britain was marked by an inner unity and an evangelical solidarity. New opportunities and grave responsibilities were created by the changed situation. Wel-

fare services to meet war needs, the interruption in the education of town children and the disruption of family life due to their evacuation, the disturbance of local parish routine by the black-out, and the induction of so many young men into the military service, were some of the problems confronting the churches.

The movement which in 1939 united the various Reformed branches to form the Reformed Church in France was most providential in grappling with the vast refugee problem created by the war. Many of the 500,000 people evacuated from the frontiers are members of this church. The Waldensian Church in Italy celebrated in September with elaborate ceremonies the 250th anniversary of the return of the Waldensians to their homeland.

In other parts of Europe the principal Reformed (*i.e.* Presbyterian) Churches have experienced—in common with the churches of other confessions—sufferings and persecutions unparalleled in modern history. The religious balance of 1939 showed a tremendous deficit in church membership, in the loss of church property and influence, and in the decrease of pastoral and educational forces of religious character.

Meagre reports from Poland revealed chaotic conditions among the scattered congregations. The Church in Galicia and the Ukrainian Evangelical Reformed Church remained in the darkness behind the iron curtain of Russian occupation. In Germany, the church faced danger in methods of intimidation which are tempting it with an ideology alien to its message. (W. B. Pu.)

Prices. *Prices of Commodities at Wholesale.*—Following the outbreak of war in Europe in September, wholesale commodity prices rose sharply in most of the countries for which information has continued to be available. Germany is a marked exception, as is clear from the chart on p. 549 comparing the movements of wholesale price levels since 1933 for the United States, Great Britain, and Germany. The sharp, widespread, and concerted rise of prices which began in September contrasts with a small and somewhat uncertain upward movement of prices for about a year after the outbreak of war in Aug. 1914. There were also important differences in the economic conditions preceding the outbreak of war in 1914 and in 1939. There was a world depression in 1914; whereas, in 1939 the business situation was more diversified. Industrial production was expanding in the United Kingdom and France, while in the United States there had been a dip in output in early 1939. Again, collectivism was a more important factor in the latter period than in the former. Thus, the German economic program in recent years includes price controls, the effects of which are clearly evident in the chart.

In the period before Sept. 1939, war had been a price-disturbing factor. The Abyssinian war contributed to the rise of prices in Italy during 1935. Beginning in 1937 the Chinese war was a factor in the upward trend shown by the Japanese price index.

In the months preceding Sept. 1939, international exchange rates had undergone various wide fluctuations, while prior to Aug. 1914, exchange rates were fixed within narrow limits by the gold standard. Sterling exchange declined in New York about 6% in the latter part of 1938. This tended to support the level of British prices in early 1939. The declining value of the yen in 1938 was a minor factor in the increase in the Japanese price level, which is shown on the chart on p. 550. Price movements in other countries have been more markedly affected by depreciating exchanges in recent years. The French wholesale price level has more than doubled since 1935. The declining value of the

franc in 1936, 1937, and 1938 contributed to the increase in the French price level during these three years. Sharp declines in Belgian exchange early in 1935 and in Italian exchange late in 1936 were partly responsible for the concomitant increases in wholesale prices in these countries. When the war broke out in 1914, American securities held abroad were dumped on the New York market and sterling and franc exchange rose sharply. This tended to delay price increases in Great Britain and France. In Sept. 1939, England and France husbanded their external credits, and sterling and franc exchange depreciated, and exchange depreciation contributed to a sharp rise of wholesale commodity prices. The rise of wholesale prices in England, as well as in countries from which she buys extensively, reflects also a much more rapid industrial mobilization for war than took place in 1914. Although price levels rose slowly at first, after the declaration of war in 1914, the rise was eventually both sharp and extensive. The memory of this war-time rise was itself a factor in the quick response to the outbreak of war in 1939.

United States.—The sharp, concerted rise of wholesale commodity prices in the United States following the outbreak of war in Europe in Sept. 1939 contrasts with the uncertain price movements during the preceding year-and-a-half. As the chart reveals, this uncertain period had been preceded by a precipitate decline in the prices of farm products and foods during the sharp business recession which began in the latter half of 1937. The decline in industrial prices during this recession was slower and considerably smaller than that in agricultural prices in spite of an unparalleled drop in industrial production.

The period of uncertain price movements was a period of business uncertainty. During the latter half of 1938 business experienced a marked recovery, to which some commodity prices responded while others did not. Early 1939 saw a mild decrease in the volume of business. Reflecting in part these business movements, a temporary check in the downward trend of the level of prices of farm products and foods in the latter part of 1938 was followed by a number of further commodity price declines in 1939. The downward movement of hog prices was halted only temporarily during 1938, and under pressure of increased supplies resumed in 1939, until in August a level of 6¢ a pound was reached. After a temporary rise in the fall of 1938, sugar declined to a low of 4.2¢ a pound in the following June. Prices of cotton and of beef cattle fluctuated uncertainly over this period, the former between 8¢ and 9½¢ a pound and the latter between 9¢ and 10¢ a pound. With a repetition of large wheat and corn crops in 1938, wheat prices fell to a six-year low at 65¢ a bushel in late 1938, and corn prices declined to 45¢ a bushel. With smaller crops, wheat prices strengthened somewhat during the spring and summer of 1939 while corn prices remained at a low level as production was maintained. The relatively stable level of the industrial price index during the 15 months preceding the outbreak of war reflects mixed movements among individual commodity prices. Prices of a number of commodities rose under the stimulus of expanding business activity during the latter half of 1938 and remained relatively stable throughout the early part of 1939. Southern pine lumber prices increased from slightly over \$21 per 1,000 bd.ft. to \$25; scrap steel from less than \$12 a ton to \$15; copper from 9¢ a pound to 11¢; and rubber from 12¢ a pound to 17¢ during the latter part of 1938. Most of these gains were maintained through the following months. Various commodity prices followed other patterns. Silk prices, after rising during the latter part of 1938 to \$1.80 a pound, continued upward as demand expanded in the face of a limited supply, reaching a level of \$3.90 a pound by the end of 1939. Prices of cattle hides rose to 14¢ a pound in Nov. 1938 and declined to less than 10¢ in the first half of 1939. Prices of finished steel,

OFFICIAL INDEXES OF WHOLESALE PRICES IN THE UNITED STATES, GREAT BRITAIN, AND GERMANY (all converted to 1929 as a base)

passenger automobiles, and petroleum declined in the latter part of 1938.

At the outbreak of war there was a concerted rise of prices in which most important commodities participated. Exceptions were brick, cement and coal, the prices of which have been relatively stable for several years at levels slightly below those of 1929, and finished steel, passenger automobiles and petroleum.

Although industrial production reached 1929 levels during the latter part of 1939, the level of industrial prices remained during this period somewhat below the peak reached in 1937. Southern pine reached a peak of \$31 per 1,000 bd.ft. in Oct. 1939 and declined somewhat thereafter. Likewise, prices of scrap steel and cattle hides reacted during the last two months of the year after reaching a peak in October, the former falling from \$21 a ton to \$18, and the latter from nearly 17¢ a pound to almost 14¢. Copper, however, rose to 12¢ a pound and rubber above 20¢ a pound, and during the last quarter of 1939 these levels were maintained.

After increasing sharply in September in anticipation of an enlarged war-time export demand, the prices of a number of agricultural commodities reacted during the last quarter of 1939. The price of beef cattle eased slightly after reaching 10¢ a pound. Hog prices declined from 7½¢ a pound to 5¢, a five-year low. Sugar, which had been below 4½¢ a pound in August, rose sharply to over 5½¢ a pound in September and subsequently declined again nearly to 4½¢ in December. Prices of wheat and corn likewise reacted during October from their September highs, but rose during the last weeks of 1939 to over \$1.00 a bushel and 57¢ a bushel, respectively, in response to reports of drought. Cotton prices rose over the entire period, to 10¢ a pound in December.

Great Britain.—During recent years the pattern of price movements in Great Britain has, in general, been similar to that in the United States. But there have been significant differences. The heavy demand for industrial raw materials under the rearmament program (as well as the weakening of the pound in the latter half of 1938) helped to moderate the downward trend in the level of prices between mid-1937 and the spring of 1939. In early 1939 prices averaged well above the level of 1936, while in the United States the early 1939 level was below that of 1936.

However, prices of both foods and industrial goods in Great Britain averaged lower in the early months of 1939 than at any time in 1937 or 1938. Steel prices which had remained firm during the 1937-38 industrial recession were belatedly cut at the

beginning of 1939, the price of rails declining from £10 to £9½ per ton. The price of copper rose in the latter half of 1938 and eased during the first half of 1939. Prices of building timber, which went below £16 per standard in Jan. 1939, and hides, which went below 5d. a pound in December and January rose sharply during the spring. Wheat and barley continued downward in early 1939, wheat to slightly over 4s. per cwt. in March and barley to slightly over 6s. in July. Mutton and sugar prices rose in the latter part of 1938 and early 1939, contrary to the general trend.

Following the outbreak of the war in September, wholesale commodity prices rose sharply. In November the level was about 120% of that of August. This marked rise took place in spite of the fact that a wide variety of commodities were subjected to supply and price controls, and in many cases maximums were established beyond which prices could not rise.

As a general rule, prices of foods were allowed to rise more than prices of industrial materials. Wheat and barley prices rose gradually, reaching over 7s. per cwt. and 15s. per cwt., respectively, during December. Granulated sugar prices, which had increased to 23s. per cwt. before the outbreak of the war, increased to 36s. in early October and remained at about this figure. Prices of Argentine beef and English mutton increased only slightly, however, before stabilizing at 70s. per cwt., and 88s. per cwt., respectively, in late September.

Maximum prices were set for the non-ferrous metals during mid-September which allowed for little or no increase in the prices prevailing before the declaration of war. Copper prices were set at £51 a ton, lead and zinc prices at about £17 a ton, and tin prices at £230 a ton. Subsequent difficulties with supply, resulting in part from marked price increases in other major industrial countries, brought about a revision of these prices during December. The maximum price for tin was removed altogether and the price rose to over £270 a ton and then receded somewhat. The maximum price for copper (including duty and delivery cost) was reset at £62 a ton, and that for lead and zinc at about £25 a ton.

Iron and steel prices were allowed to return to about their 1937-38 levels late in the year, with steel rails going to about £10 a ton and Cleveland pig iron to 108s. a ton. Prices of building timbers remained at about £24 per standard from late in September through the balance of the year. Among other industrial commodities, moderate increases were allowed from time to time,

OFFICIAL INDEXES OF WHOLESALE PRICES IN FRANCE, ITALY, BELGIUM, AND JAPAN (TOKYO, BANK OF JAPAN) (all converted to 1929 as a base)

hides rising to over 8d. a pound in December, rubber to about 12d. a pound, American cotton to nearly 9d. a pound, wool tops to nearly 32d. a pound, and Welsh coal to over 27s. a ton. (See also AGRICULTURE: *Wars and Prices*; COST OF LIVING; FINANCIAL REVIEW; and articles on individual commodities.) (M. A. Co.)

Prices, Commodity: see AGRICULTURE; PRICES.

Primary Education: see EDUCATION, ELEMENTARY.

Prince Edward Island, the smallest but the most densely populated province in Canada, lies in the Gulf of St. Lawrence in the shape of a crescent, its inner side towards the north. It is nine miles from the mainland. Across the separating strait, powerful ice-breaking ferry-boats ply in winter and summer carrying railway cars, automobiles, passengers and freight. There is also a daily air mail and passenger service connecting with trans-continental Canadian Airways. The island is 137mi. long, and varies in width from 2 to 32 miles. It contains 2,133 square miles. The population, Canadian census 1931, was 88,038; estimated Dec. 31, 1939, 91,000 of which 81% is rural. Charlottetown, the capital, 12,361; estimated Dec. 31, 1939, 13,000. Of the island's population 80% are of British descent; 14% French; 42% are Roman Catholic and 58% Protestant, of which 28% are of the United Church, 18% Presbyterian; and 6% Anglican. The Legislative Assembly consists of 30 members, 2 from each of 15 electoral districts.

To Dec. 31, 1939 the estimate of revenue was \$1,900,000; estimated expenditure, ordinary, approximately the same; capital expenditure including provision for sinking fund \$800,000, of which interest absorbed \$300,000. The Dominion subsidy was approximately \$650,000. Of the revenue, \$370,000 went to education, the total cost of which was \$555,000. Pupils enrolled were 18,600; cost per pupil \$30; teachers 710; average salary \$502. The public debt Dec. 31, 1939 was approximately \$6,000,000; per capita \$68. Income, real estate and succession taxes are moderate.

The main occupations are agriculture and fishing; 485,000 acres are under cultivation. The capital investment in agricultural in-

dustry in 1939 was \$53,460,000; in manufacturing industry, \$2,400,000. The estimated total value of farm products in 1939 was over \$12,000,000; potatoes (approximately) 5,800,000bu.; turnips 4,000,000bu.; oats 4,800,000bu.; wheat 320,000bu.; hay and clover 401,000 tons; butter 1,850,000lb.; cheese, 450,000 pounds.

The estimated value of fisheries was \$650,000; oysters 900,000lb.; estimated fox pelts, 80,000, valued at \$1,800,000. There is little serious crime, and practically no illiteracy. (Cy. M.)

Princeton University during 1939—its 192nd year—improved its curriculum, in pursuit of a policy of meeting the needs and aptitude of the individual undergraduate.

Continuing to cut new doors in the academic walls which divide departments, it applied to the social sciences, through reorganization of undergraduate instruction in the School of Public and International Affairs, the principle of cross-departmental specialization that had been previously tested in the humanities. Thereby it opened up, as a single field of selection for individual programs, the whole range of the social sciences.

Among new research projects was the establishment of the Princeton Listening Center to record and analyze war propaganda broadcast by European nations. Gifts received totalled \$1,581,624.84. Enrolment, which is controlled by a policy of limitation, was 2,714, of which 299 were graduate students. The teaching staff numbered 403. (H. W. Do.)

Principe: see PORTUGUESE COLONIAL EMPIRE.

Printing. Perhaps the most striking and important development of the year in the printing industry took place near the end of 1939. As a result of this development, printing ink, heretofore invariably in thick liquid form, is made available in powdered form with indications of very definite advantages. It is put into the enclosed ink fountain of the press, which is heated. The press rollers, preferably of rubber or synthetic rubber, take the ink, now in liquid form, from the fountain and apply it to the curved plates on the press cylinder, which is also heated to keep the ink liquid. The very instant the warm ink strikes the relatively cold paper, however, it dries. This obviates off-setting, that is, ink of a printed sheet not yet dry smudging the next sheet or opposite side of the roll.

There is not only the advantage of improved quality but presses may be speeded up when no allowance for time for drying is necessary.

This so-called "cold-set" method follows closely upon another development in inks known as "heat-set," "Vaporin," and by other names. As the term implies, drying of ink by the latter method is hastened by the inks being quick-drying themselves but especially by application of heat to the sheets instantly after printing. "Heat-set" inks were a decided boon to magazine publishers and merchandisers requiring large catalogues with pictures in full colours on smooth paper because they permit faster production and because they are a protection against offsetting. Developers of the powdered ink (cold-set) claim, and the claim appears reasonable, that it represents a further advance.

The offset (the term is not to be confused with the word as used above), or planograph, method of printing continued advancement, especially in the newspaper field. The Trenton, New Jersey, *News-Advertiser* which in 1938 adopted offset for pictorial sections in monochrome, ordinarily done by rotogravure, has progressed in the use of this kind of printing. It now prints such sections in full natural colour, having done so since early in 1939.

A new all-offset daily paper was announced during 1939 from Hartford, Connecticut. A number of so-called "country" news-

papers turned to offset. The lure is pictures of more detail than is possible by the regular letterpress method with stereotypes cast from regulation copper photo-engravings.

In process of development for several years, a new method of machine typesetting advanced materially toward the practical stage during 1939. Speed is apparently its chief advantage. It is reliably said that the machine composes type at the rate of 14,000 ems an hour. If it maintains this rate under actual shop conditions later on, it will prove to be considerably faster than present types of composing machines. Other factors, like cost of the type, will have an effect on the economy of the system. Instead of the product being one piece for a complete line or a combination of single letters, full type height (.918 inch), type is like just the top part of the letter, say $\frac{1}{8}$ -in. high, in short quite similar to the steel types used on the common multigraph machine. These are caused to drop in place in a grooved base (which makes them type-high) by striking keys for the different letters and characters just as the linotype is operated, although the keyboard is that of the standard typewriting machine and not that of the linotype.

The year witnessed a gigantic show of printing equipment at Grand Central Palace, in New York city. While all items showed progress, few were of major importance or indicated any decided change.

Worthy of note was the development in making plates for offset by projection. Ordinarily a negative is made from the copy, photograph, or painting to be reproduced, of the size the printing plate must be. By the new method the negative may be very small and the plate very large, the negative being projected upon the sensitive press plate as a lantern slide is projected upon the screen. By the older method the negative was "printed" by contact with the press plate just as films are printed on paper in amateur photography. By the projection method, small Kodachrome films may be blown up to tremendous dimensions, saving a great deal in negative costs. The photographic equipment in great size is being made up for the army to be used in making giant-sized maps. (See also NEWSPAPERS.) (J. L. F.)

Prisons. During 1939, new buildings were constructed, or were in the process of construction, in some prisons of the United States. At the Kansas State penitentiary, a three story structure was added to the institution to house the kitchen, commissary, and school. The Arkansas State penitentiary built an up-to-date hospital, and two new dormitories exclusively for Negro inmates. At the Arizona State prison, two new dormitories also were erected; one within the walls, and the other, designed for trusties, outside the walls. Colorado State penitentiary completed a maximum security cell block, and has just commenced the construction of a new dining room to accommodate 1,400 men.

Two large duplex dormitories were built at the Connecticut State Farm for Women, while at the Maine State prison, a new wing was added to the cell block. The California State prison at San Quentin had a fireproof industrial building under course of construction to house the following industries: shoe, clothing, furniture, and printing. At the Kentucky State penitentiary, a new kitchen, dining room, cold storage plant, garage, and three cell blocks were being built.

In New York State, a maximum security prison was being erected at Green Haven. Earlier in the year, the cornerstone of the Church of St. Dismas, the Good Thief, was laid at Clinton prison, Dannemora. This structure, one of the first of its kind in the United States, will have a seating capacity of 1,200, and its construction, including the shaping of the native field stone and the fashioning of the altar and pews, has been entrusted to the prisoners.

Although New York State has previously provided its penal in-

stitutions with psychiatrists, psychologists, and an adequate personnel for its prison schools, recent cuts in the budget have virtually wiped out these departments. Consequently, segregation of various types of criminals will now be largely impossible since the specialists trained for that work are no longer associated with the prisons. Thus, the effective accomplishments of the past ten years are practically vitiated.

In North Carolina and Texas, however, much progress has been made in the classification and segregation of inmates. And of particular importance is the fact that in these States the maintenance of prison camps makes this work much easier, because prisoners most amenable to reform can be sent there. Alabama State prison also undertook in 1939 the scientific classification of all inmates.

At the Rhode Island State prison, the dungeon formerly used to discipline intractious inmates has been eliminated. This section consisted of an ordinary cell with a solid wooden door covering the usual grille door. Prisoners confined there were fed entirely on bread and water, and given a regular meal but once every five days.

The wooden door has now been removed and regular rations substituted.

During 1939, the Federal Government appropriated \$14,000,000 for the repair and construction of Federal penal and correctional institutions. Nineteen projects were approved which included the construction of a medium security prison in Indiana; farms for short term prisoners in Colorado, Connecticut, Kentucky, and Texas; and additional hospital and other facilities at many of the units now comprising the Federal prison system. Work on these projects was started in 1939, and most of them will be completed very shortly.

At the annual meeting of the American Prison Association, Alexander Patterson, His Majesty's Commissioner of Prisons for England and Wales, reported on the British system of handling offenders under 21 years of age. These youthful inmates are not confined in prisons with older and hardened criminals, but are sent to what are known as Borstal Institutions. There are nine such institutions, and their populations range from 100 in the smallest, to 300 in the largest. Because of these small inmate quotas, the officials can more easily and effectively rehabilitate their charges.

As for European penal activities, little information is available because of the war. However, in England and Germany, men whose sentences ran three months or less, were released to engage in military service or other war operations. (L. E. L.)

Pritchett, Henry Smith (1857-1939), U.S. scientist and educator, was born in Fayette, Mo. on April 16, the son of Prof. Carr W. Pritchett, a distinguished teacher who founded Pritchett college at Glasgow, Mo. Henry Pritchett graduated from his father's college in 1875 and the next year began the study of astronomy at the U.S. Naval Observatory under Asaph Hall. In 1878 he was appointed assistant astronomer at that observatory, and two years later he returned to Glasgow as chief astronomer of the observatory there. From 1883 to 1897 he was professor of astronomy and director of the observatory at Washington university in St. Louis. President McKinley appointed him superintendent of the U. S. Coast and Geodetic Survey in 1897, and in this position he introduced civil service for the first time into the bureau and conducted several important investigations of the American coastline. He resigned in 1900 to accept the presidency of Massachusetts Institute of Technology. Six years later he was selected as president of the new Carnegie Foundation for the Advancement of Teaching, which office he held until his retirement in 1930. He died at Santa Barbara, Calif. on August 28.

Propaganda. In war-time, the conquest of public opinion is sometimes as important as victory in the field; and especially in this age of total warfare, when the conflict is not so much between armies, fighting on distant fronts, as between whole nations. Of all the lessons of the World War (1914-18), this was, perhaps, the one that Adolf Hitler took most to heart. The ex-army corporal would not, or could not believe that Germany was ever defeated in the field: "the Fatherland collapsed behind the lines, slowly, under the withering fire of Allied propaganda," wrote Adolf Hitler in *Mein Kampf*. On assuming the Chancellorship, he, therefore, made the Ministry of Propaganda and Public Enlightenment an integral part of Germany's war machine. If his armies were later to walk into Austria, Sudetenland, and Czecho-Slovakia almost without opposition, it was partly because Dr. Paul Joseph Goebbels had been successful in undermining opposition first, not only in those nations, but throughout Europe and in the United States, as well.

The United Kingdom and France were slow to realize this; but apparently the law of diminishing returns operates in propaganda, too. Herr Hitler's technique was always the same—to shame the Allies by talk of the iniquities of Versailles; to gain their sympathy and support by holding Germany up before the world as the only bulwark against Communism; to disrupt the nations of central Europe by propaganda-inspired movements for *Anschluss*. It worked for nearly six years; but eventually it became an oft-told tale, which annoyed many and convinced few. Then, in one swift move, Herr Hitler shattered the myth of his undying enmity for Communism. Seemingly, his object was to frighten England and France into acquiescence now that his propaganda could no longer seduce them. He failed. On September 1, war broke out in Europe.

In the United States the post-war years of disillusionment had served to make the people only too aware of the power of propaganda. A nation, which had gone to war to make the world safe for democracy and to insure everlasting peace, saw only dictatorship and militarism in Europe. Studying the history of America's participation in the war, as described by Walter Millis, Oswald Garrison Villard, H. C. Peterson, Senator Gerald P. Nye, and many others, millions became increasingly convinced that the U.S. had been duped into fighting—perhaps by the Allies, or by "Wall Street," perhaps by the "Merchants of Death," but certainly by propaganda. The very word seemed enough to frighten them. On the whole they were not so much afraid of German propaganda, however; six years of National Socialism had made the name Adolf Hitler anathema in the United States, and even the Germans hoped to achieve little more by their propaganda than strict American neutrality as defined in the Neutrality Act of 1937.

Quite naturally, this allergy to Allied propaganda heartened the German propagandists. Seeking to counteract it, the Allies hastened to assure the American people that it was not their intention to carry on propaganda in the United States. In the words of Lord MacMillan, one-time Minister of Information, their attitude was that "We are content with Hitler as our propagandist." It was said that no lecturers would be sent to the U.S., as lecturers were sent by Sir Gilbert Parker in the World War (1914-18). Later, when lecturers did begin to come, they insisted that arrangements for their visits had been made long before the invasion of Poland. However, in the *New Statesman and Nation*, H. G. Wells revealed that semi-official suggestions had been made to him to visit the United States. Apparently, the assurance that "We are not carry-

ing on propaganda" was itself propaganda, designed to allay suspicion. It was coupled with the assurance that England and France were fighting the fight of democracy against totalitarianism, law and order against the rule of force. A United States of Europe led by the democracies would result if the Allies were victorious, Americans were told.

Official documents rolled from the presses, as each government sought to place responsibility for the war. Germany charged that England, alone, was responsible, absolving France. The French, it was said, had been willing to negotiate at the last moment, while the German armies were already well into Poland. Over and over, the French were told in short-wave radio broadcasts: "England will fight until the last Frenchman." This attempt to divide the Allies by propaganda was unsuccessful; and their official documents agreed that Germany had been offered the chance to negotiate but would not accept it, preferring unconditional Polish surrender or war. Planes of the Royal Air Force roared into Germany, peppering the Reich with handbills which called on the people to overthrow the National Socialist régime.

Then, Adolf Hitler launched his so-called peace offensive, with the help of the Soviet Union. This was designed further to absolve Germany of war-guilt, for, even though Herr Hitler knew that peace was impossible unless the German armies withdrew from Poland, the German propaganda-machine described the rejection of his offer as conclusive evidence of the Allies' desire for war. The Soviet propaganda-machine chimed in, saying that if Germany had been the original aggressor, the roles were now reversed.

More and more, as the war progressed, Soviet propaganda began to echo the German. The non-aggression pact between the Soviet Union and Germany represented no quicker right-about face for Herr Hitler than it did for Josef Stalin. Ever since 1935, the Soviet Union had sought to line up the democracies against Germany, denouncing National Socialism, denouncing attacks on smaller nations, praising democracy, and distinguishing between the imperialism of England and France and the imperialism of the Reich. Now that Germany and the Soviet Union were friends, if not allies, Soviet propagandists had to sing another tune. The democracies were as reprehensible as Germany; indeed, the democracy of England and France was only "sham." American foreign policy, which the Soviet propagandists had formerly praised, became "war-mongering." As the Red Army marched on Finland, they joined with the Germans in ridiculing the announcement of the Allies that Austria, Czecho-Slovakia, and Poland would some day be reconstituted in one form or another. The right of smaller nations to exist, which, for 20 years, they had so ably defended, it was now convenient to forget.

Important volumes which appeared on propaganda during the year 1939 included:

H. C. Peterson, *Propaganda for War* (1939). Peterson skillfully analyzes steps taken by the British Government to break down American neutrality in the period 1914-17.

Sidney Rogerson, *Propaganda in the Next War*, London (1939);* Rogerson wrote just prior to the war which began in Sept. 1939. He set forth propaganda policies which England should follow in the expected war. He emphasized especially what should be done to break down American neutrality in the expected war.

James R. Mock and Cedric Larson, *Words that Won the War* (1939). Mock and Larson review the work of the Creel committee during America's participation in the World War (1914-18). They show that the American Government had a monopoly of propaganda and of the various channels through which propaganda flowed to the American people. They indicate that in any new war there will be another Government monopoly of propaganda with the chief executive at the head of it.

Adolf Hitler, *Mein Kampf*, complete and unabridged, fully annotated, Reynal (1939). Also, unabridged edition, Stackpole & Son (1939). The two unabridged editions of Hitler's *Mein Kampf* brought to Americans for the first time, a clear picture of Hitler's propaganda methods. Considered in connection with his accomplishments since 1933 in building a strong Nazi Germany, these methods reveal Hitler as perhaps the greatest propaganda genius of modern history.

*First published 1938; reprinted 1939 and given its first big publicity in 1939.

Volume II, *Publications of the Institute for Propaganda Analysis, Inc.* (1939). The Institute's second published volume represents an attempt to illustrate analytical methods set forth in its first volume published in 1938. The chapters in volume II are devoted to the following: The Munich Plot; The Attack on Democracy; Communist Propaganda, U.S.A.—1939 Model; Propaganda in the Schools; Father Coughlin: Priest and Politician; Britain Woods America; Spain: A Case Study; The Associated Farmers.

Institute for Propaganda Analysis, *The Fine Art of Propaganda*, edited by Alfred McClung Lee and Elizabeth Briant Lee (1939). In the *Fine Art of Propaganda*, Doctors Lee define and illustrate the seven common propaganda devices as these have been set forth by the Institute for Propaganda Analysis: Name Calling; Glittering Generality; Transfer; Testimonial; Plain Folks; Card Stacking; Band Wagon. Specifically, most of the illustrations in the book reveal how Father Charles Coughlin, the radio priest, used the devices in his radio sermons and addresses.

American attention in 1939 was focused on propaganda, not only as a result of the European war but as a result also of the work of the so-called Dies Committee—a Congressional committee to investigate "un-American activities." The committee revealed numerous Communist and Nazi activities and propagandas. Some significant activities and propagandas, notably those of the Christian Front and Father Coughlin, were analyzed by *The Nation* of New York. Its revelations were documented further in an address by its editor, Freda Kirchwey before the Institute of Human Relations at Williamstown, Massachusetts. An account of the Williamstown Institute discussion of propaganda and democracy appeared in *Survey Graphic*, for Nov. 1, 1939. (C. R. Mr.)

Protestant Episcopal Church. In the Episcopal Church the year 1939 was one of quiet work and of effort to maintain and strengthen the spiritual life of the church in the midst of the present world-wide anxiety and distress. The continued financial difficulty and depression in the United States was reflected in the situation of the Church in regard to its Missionary work both in the U.S. and in Europe. At the opening of 1939 the church found itself confronted with a deficit of \$300,000 in its budget for General Missions but as a result of a special campaign most of this amount was raised and the church was thus saved from the serious reductions in its expenditures for its missionary work which would otherwise have been necessary.

The Forward Movement inaugurated by the General Convention in 1934 continued its work and has given its efforts largely to the circulation of devotional and religious literature throughout the church.

An event of much importance, and one widely observed during 1939, was the 150th anniversary of the adoption of the Book of Common Prayer. During the whole of its history in the United States from the beginning, the church had faithfully used the Book of Common Prayer and had fully recognized its authority as the official standard of doctrine and worship, but in 1789 the Prayer Book was officially adopted by the Protestant Episcopal Church as autonomously organized after the War of Independence. The preface of the Prayer Book as thus adopted by the Episcopal Church declares that "this church is far from intending to depart from the church of England in any essential point of doctrine, discipline, or worship; or further than local circumstances require."

The official reports for 1939 show a total of 2,157,000 baptized persons, an increase of 46,801 during the year, and a total of 1,466,598 communicants, an increase of 26,630. (W. T. M.)

Psychiatry. During the year 1939 the active treatment of the psychoses, particularly schizophrenia, begun a few years ago, was carried out to a greater extent than ever before. The hypoglycaemic shock treatment was continued, although in a modified form. In addition to insulin shock, metrazol was used extensively, as well as narcosis therapy. The original insulin treatment by Sakel is now largely supplanted by the so-called "block" method of treatment, in which a series of insulin treatments leading to coma are combined with an equal series

of metrazol treatments associated with paroxysmal seizures. These treatments are given alternately. In addition, prolonged insulin coma has been used, up to 12 or more hours. The effect of this type of treatment cannot be evaluated at the present time. One can only say that shock treatment of any type has been effective in schizophrenia. Many patients are now reported as free from symptoms. Relapses, however, are common and the treatment often has to be repeated. It would appear, after a period of five years since Sakel introduced his insulin treatment, that only a few patients have been cured by this method. In many the duration of the illness has been decreased and the periods of remissions greatly extended. In clinics all over the world patients are being treated by the coma or convulsive form of treatment. It will take, however, a decade before a final report can be given in regard to the actual value of this type of therapy.

A similar form of treatment is that known as narcosis therapy. This treatment consists of the use of narcotic drugs to induce sleep for the greater part of 24 hours, on successive days, for periods ranging up to 14 days. The modern use of this treatment dates from the report of Kläsi in 1922. It is used chiefly in the treatment of schizophrenia. It has not increased the recovery rate of the disease, but it does curtail the duration of the psychotic condition and makes the administrative care of chronic psychotic excitement more manageable.

In contrast to the forms of treatment outlined above, new surveys of ordinary hospital treatment have been made by psychiatrists in order to correlate their results with the results of more active forms of therapy. It has been found that patients with schizophrenia under ordinary hospital conditions recover in a period of three years, at a rate of about 33%. About 50% remain in the hospital at the end of this period. These results are not as good as those following treatment by continuous narcosis, hypoglycaemic shock or metrazol.

Another form of treatment for schizophrenia has been brought to the attention of psychiatrists by Myerson and Tillotson. This is known as the "total push" method. In general, patients with chronic schizophrenia, hospitalized for many years, are treated intensively with physiotherapy, irradiation, exercises, games, special diets and psychological methods. Particular attention is paid to their clothing and they receive praise, blame, reward, or punishment according to their actions. The results of this simple method have been encouraging and it is believed by the authors that even if the insulin and metrazol methods are used, the "total push" method should be instituted in its fullest sense as an important adjunct.

The operation on the frontal lobes first suggested by Moniz in 1936 has been carried out in a number of clinics, largely for symptomatic treatment of tension, apprehension, anxiety, depression, agitation, etc. One report indicates that 15% of the patients were greatly improved and 50% moderately improved. The operation has not been widely accepted, but appears to have considerable merit.

In 1937 Lehmann-Facijs described a chemical test of the blood, which he had found positive in a large percentage of cases of schizophrenia. Realizing that schizophrenia is not a definite disease entity but only describes a group of patients with certain symptoms, he nevertheless, in testing large numbers of patients with psychoses, found that 88% to 92% of those with schizophrenia gave a positive test, whereas less than 40% of other types of patients showed changes. The other types of patients, moreover, suffered almost exclusively with destructive diseases of the nervous system such as multiple sclerosis, tumour and types of degeneration. A further report from the same clinic in 1938 indicated that the test appeared to be of even more value in the diagnosis than originally supposed. In other clinics where the test has been

used it has also proved to be unusually positive. One clinic reports positive reactions in 91% and another in 100%. The test, however, cannot be evaluated until more data are collected from various clinics throughout the world.

An important step in the legal aspects of psychiatry was taken by the State of New York when the lunacy commissions were abolished. Under the old system the court appointed a three-member advisory committee consisting of at least one qualified psychiatrist and one lawyer. Defying public opinion, judges appointed their relatives, political district leaders and other followers. The new law, which went into effect in 1939, substitutes for the lunacy commission a board of three psychiatrists, who pass upon the question of the sanity of the defendant at the time of the trial, an important point, for the psychiatrists are not required to determine the mental condition of a defendant at the time of the commission of a crime; in other words, they are only requested to state whether or not the defendant is able to understand the proceedings of a court trial. This law, known as the Desmond law, should have a wide influence as a guide to future legislation. (See also NERVOUS SYSTEM.)

Psychical Research. During 1939, experimental investigations in psychical research were, in the United States, devoted to further research in extra-sensory perception (ESP). The early controversial phase of this research has shown a marked decline, accompanied by a general recognition that the research problems fall specifically within the field of psychology. Three symposia on ESP research methods scheduled by psychological societies have indicated this trend. The Southern Society for Philosophy and Psychology, meeting at the University of North Carolina, was the first to hold a symposium arranged by research workers who had used the methods under discussion. Recognition of ESP as a psychological problem has tended to limit research methods to the techniques of the university laboratory. Knight Dunlap (University of California) and six other experimental psychologists, in a recent article, proposed standardized test methods many of which had already been in use in the Duke Parapsychology Laboratory. Rhine (Duke) proposed a number of requirements for a mechanical selecting and recording device for ESP tests. Greenwood (Duke) introduced a mathematical technique to correct possible exaggerated probability values from optional stopping of experimental series. Studies in possible sources of error in recording techniques were continued by Kennedy (Stanford).

Murphy and Taves (Columbia) presented four different ESP test situations to their subjects, and found that even though no significant deviations occurred for the total results, the variations in correct response to the four tasks were positively correlated. Pratt and Woodruff (Duke) carried out a 60,000 trial series with college student subjects, in which they found that scores did not vary with the size of the symbols used. This experiment, conducted under the most stringent conditions for the exclusion of alternative hypotheses yet attempted in ESP research, yielded significantly positive evidence for extra-sensory perception.

An interesting approach to the theory of ESP is offered by the philosopher, O. L. Reiser (Pittsburgh). Reiser bases his theory upon the notions of emergent evolution, non-Aristotelian logic and a hypothetical psychic ether. He concludes that clairvoyance and telepathy are emergents in the process of development of a "world mind."

Whately Carington of the Society for Psychical Research (London) renewed his quantitative study of mediumistic trance personalities. In his experiments, the same "communicating" personalities were produced by different mediums. Word association tests were given the mediums in the trance state and the normal state, and similarities and differences calculated. John Hettinger studied the "ultra-perceptive faculty" of mediums by statistical evaluation of their responses to pictures and reported positive conclusions.

Recent summaries of the field of psychical research include *Beyond the Senses* by Charles Francis Potter, *Fifty Years of Psychical Research* by Harry Price and *A Cavalcade of the Supernatural* by Harold H. V. Cross.

The death in 1938 of Professor William McDougall, co-editor with J. B. Rhine of the *Journal of Parapsychology*, was a distinct loss to psychical research. Editorship of the *Journal* was taken over in 1939 by Gardner Murphy of Columbia university and Bernard Riess of Hunter college. (See also PSYCHOLOGY.)

(J. B. R.)

Psychoanalysis: see PSYCHIATRY.

Psychology. Today the field of psychology as a whole is characterized by a catholicity of interest and activity in keeping with the tremendous scope of its subject matter. Reports of research at the 1939 annual meetings of the American Psychological Association ranged from accounts of the influence of pressure upon the polarity potential of the human eye to a field study of the acculturation of second-generation Italians. In spite of the diversity of interests three major areas of concentration are discernible. The broad domain of learned modifications of behaviour is being thoroughly explored. A second area comprises research upon the chemical or internal environment of the organism and includes experiments upon drug and hormone effects. Finally there bulks large the development of methods for dealing scientifically with the social relations of man.

The Conditioned Response.—In an effort to retain the preciseness of a mechanistic view of man and still keep the common sense of a purposive conception, a dichotomy has been established between two types of conditioned response. Type A is the old Pavlovian conditioning which the behaviourists made their central principle. For example, an indifferent stimulus (such as a sound) if presented immediately prior to an adequate or unconditioned stimulus (such as a puff of air in the eye) will in time evoke the response (the eye wink), even though unaccompanied by the adequate stimulus. In Type B instead of simple stimulus substitution, a response which brings reward (such as pressing a lever which releases a pellet of food) is soon learned as a means of obtaining the reward. Type A emphasizes a mechanical association of two stimuli in time with the one stimulus acquiring the motor discharge of the other. Type B emphasizes the law of effect, and calls attention to the motive of obtaining a reward or of avoiding a painful stimulus. Experimentally much more rapid conditioning can be obtained in Type B than in Type A.

Nevertheless it seems unwise to infer two distinctive processes since Type A and Type B refer to different experimental situations. In the first type the situation is oversimplified and conditioning as mere linkage is the logical result. In the second type the situation is more complex with some measure of problem solving involved. Logically this latter process may be a quantitative complication of the former.

Experimental work, moreover, shows that the two types of conditioning are not alien even from the point of view of motivation, for the unconditioned or adequate stimulus in Type A has the same reinforcing or activating function as has the reward or punishment in Type B. If the unconditioned stimulus is not occasionally reintroduced, the conditioning dies out—a phenomenon known as experimental extinction. Now Culler, Finch and Brogden have shown that experimental extinction does not occur if another stimulus is used as a reinforcing agent, even though this new stimulus does not itself become conditioned. The presence of some strong stimulus to keep open the nervous pathways within the organism is more important than mere external contiguity for both types of conditioning.

Other recent experimentation in conditioning includes the following findings:

- (1) Conditioned responses which are invariably reinforced during training extinguish more rapidly after training than do responses which are irregularly reinforced. Human subjects who received an air blast on the eye 100% of the time during training did not maintain as high a level of performance as did subjects who received only 50% reinforcement.
- (2) Though the conditioned response is fairly consistent in a given individual, different individuals show qualitatively different patterns of response under the same experimental conditions even in the relatively simple reaction of the eyelid to light.
- (3) Sensory preconditioning has been definitely established. W. J. Brogden paired light and sound stimuli, neither of which evoked any overt responses from the experimental animals. Then the light stimulus was presented simultaneously with shock until the light alone produced withdrawal. Finally the previously paired sound was used alone and this, too, evoked conditioned withdrawal.
- (4) Conditioned salivary responses can be built up to configurations of stimuli as well as to simple stimuli. G. Razran has demonstrated conditioning to patterns or ratios of light or sound even though the component stimuli of the ratios did not themselves call out the conditioning.
- (5) Pavlov's method of producing experimental neurosis in dogs has been extended to other species and the neurotic behaviour has been more thoroughly studied. N. Maier has reported that rats whose previously established conditioned discriminations are thwarted will exhibit such abnormal response patterns as intensive tics, running in circles, and varying degrees of coma.

Effects of Drugs and Hormones.—The cumulative effect of contemporary research on drugs, chemicals and hormones has been making itself felt both upon the trends of psychological experimentation and upon the explanations of developmental and behavioural processes. The apparent success of many hospitals in the use of metrazol and insulin in treating schizophrenic patients has stimulated investigations of the effects of drugs upon the action of the nervous system, upon mood, and upon conduct. A number of investigators report that metrazol produces its convulsive effects through stimulation of centres in the brain stem. If certain stimulating drugs are used in conjunction with metrazol, sensitivity to metrazol is increased. On the other hand, the so-called brain stem narcotics increase the tolerance of patients to metrazol, whereas the bromides do not inhibit the convulsion. Insulin affects the nervous system through lowering the oxygen utilization of the brain. In one experiment the phrenic nerves of cats subjected to at least ten days of treatment with convulsive doses of insulin were removed. Measurement of the after-potentials, when these nerves were stimulated, showed that the more severe the insulin convulsion the longer the after-potential.

Benzedrine sulphate, used medically in the treatment of narcolepsy, certain depressive mental states and similar conditions, has been the subject of considerable psychological research. B. F. Skinner and W. T. Heron report that after several days of extinction a conditioned response in a rat was restored to its full extent by the administration of benzedrine. Experimenters agree that this drug enhances subjective feelings of well-being. Boredom, resulting from the carrying out of repetitive monotonous tasks, has been counteracted by small doses of benzedrine sulphate and ephedrine hydrochloride. E. Reifenstein and E. Davidoff report also the following major effects of this drug: general stimulation of mental processes, enhancing of the speech function, and an acceleration of motor functions. On the other hand, these

investigators emphasize the general nature of the effects and the difficulty of predicting how any given individual will react, because paradoxical effects which reverse the above picture are not impossible.

More important, however, than studies of drug effects are the investigations of hormones, the chemical products of the endocrine glands; for the whole internal chemical state of the organism is maintained by the functioning of the endocrines. On the physiological side the isolation and chemical characterization of hormones is proceeding successfully. The present emphasis is upon the more difficult problem of the interrelationships of the hormones, especially in the field of sex. On the psychological side research is accumulating concerning the relation of sex hormones to mood and conduct. N. Miller has studied clinical cases of castration and senile prostatic hypertrophy during treatment with the male hormone substance, testosterone propionate. In general the patients not only reported stronger sex desire, but most of them changed from states of depression to states of elation with regression to their original pattern during periods of control injection. In particular the castrates under treatment exhibited more rational aggressiveness and less irrational irritability. R. T. Sollenberger found that the behavioural changes during adolescence are related to the male hormone. In a group of 30 boys the degree of maturity of interests and attitudes varied with the amount of male hormone found in the urine. The specific effect of testosterone propionate as the instigator of sex behaviour has appeared in a number of studies. C. Stone, for example, produced precocious sex behaviour in young rats by the injection of the male hormone.

Social Functions.—Advances have been made in the methodology for studying complex questions of motivation and behaviour which have significant social implications and which cannot always be brought into the laboratory. F. H. Allport and his students have developed an observational approach which emphasizes two criteria: (1) teleonomic description or the characterization of actions in terms of their purposive aspect; (2) the recording of these acts on telic scales previously constructed by psychophysical methods. The latest study from this school is a systematic exploration of the relations between obedience to the law, ideological conceptions of the law, and effect displayed toward laws. In general the dissociation between behaviour, ideology and effect is marked, but for certain individuals an institutional view of the law was associated with law-abidingness.

Another attack upon social problems is the application of psychoanalytic concepts in modified form to normal social relationships. For example, in the recent work, *Frustration and Aggression*, appears a systematic formulation of hypotheses inspired by Freud and Adler and so stated as to permit of experimental and observational test. In this system aggression is viewed as the result of frustration and its overt manifestation is a function of the degree of frustration and the severity of the anticipated punishment. A radically different methodological approach is furnished by the techniques of factor analysis developed by L. L. Thurstone. The purpose of factor analysis is to find by statistical means the number of unitary factors which lie back of any series of correlated measures. It is a tool for seeking answers to such questions as: What factors can be analyzed out of the data on delinquency as independent and primary? Basic to factor analysis is the assumption that measures which correlate highly with one another are saturated with the same common factor. By the use of this method Thurstone has found 12 primary mental abilities which account for the scores made by a group of over 200 students on a battery of 57 mental tests. The first seven factors Thurstone identifies definitely as spatial, perceptual, numerical, verbal relations, memory, words (single words) and induction. (See also

Psychology, Applied. The trends apparent in the field of applied psychology in 1938 were emphasized and intensified during 1939. There were many evidences of an increasingly strong inclination to rely upon controlled research rather than upon proclamations based only on dramatic examples. A healthy tendency towards self-criticism manifested itself in a number of articles dealing critically with basic methods and in a growing insistence upon statistical verification of validity instead of a tacit assumption that methods were producing results. Technological publications from the warring nations showed a definite trend toward a concern with military problems as well as a marked impress from the ideology of the countries involved. The outbreak of hostilities in Europe caused the abandonment of plans for an international psychotechnological congress. There was, however, intensive discussion of topics in applied psychology at the annual meeting of the American Association for Applied Psychology and at the Seventh International Management Congress.

Accidents.—Although figures for accident-fatalities in 1938 had dropped slightly below their anticipated level, there was no slackening of effort in investigating the causation and possible prevention of accidents. Data from all countries continued to demonstrate that accidents are not uniformly distributed through the population but that a group of *accident-prone* individuals incurs more than an anticipated share of accidents. Attempts to determine in advance the characteristics of those liable to accident proneness have resulted in tests which are useful in selecting commercial drivers but are of dubious value in licensing the general population. Preliminary studies gave increasing hope that the tests might be used educatively to warn drivers of their shortcomings and thus reduce an accident-toll which internationally has reached dramatic proportions.

Attempts to study the causes of accidents pointed unmistakably to human failure as the source of primary responsibility. Improvements in highways were found to reduce accident rates only as they reduced possibilities of human failure. Beyond this, it was found that accidents ordinarily result from a complex of causes in which it is difficult to detect a single condition as primarily responsible. Extensive researches showed that accident-rate varies with age and that youthful drivers, while scoring high on many tests of mechanical performance, incur accidents with a disproportionately high frequency. Attempts were being made to test large numbers of drivers for alcoholic content of the blood at specified hours, so that a base might be established for the investigation of drinking as a factor in accidents. Until this has been done, figures on "drinking drivers" can cast but little light on

the role of alcohol in accident-production.

Aviation.—Except for a few investigations of the effects of low oxygen and high altitudes, relatively little has been done since the close of the World War to study the manifold psychological problems in aviation. The year 1939 saw an international rebirth of interest in these topics. Reports from Spain, Rumania, Germany, England and the United States indicated that psychologists were again being invited to concern themselves with the task of aiding in the selection of aeroplane pilots. Responsible executives in commercial and military aviation were confronted with the fact that proper selection of candidates might greatly reduce the cost of training pilots and markedly decrease the accident rate. There were signs of wide-spread dissatisfaction with arbitrary standards long accepted and an inclination to establish new standards by direct investigation.

Efforts were being made to establish a battery of tests from which a combined score might be used to predict later success in flying. As in automobile driving, it was obvious that mere aptitude in handling the controls would not be adequate and that certain other aspects of behaviour must be measured. In the European countries the problem was almost entirely under military sponsorship. In the United States, however, a nation-wide program of research was set up in conjunction with the proposal of the Civil Aeronautics Authority to train 11,000 student pilots. This program, under the auspices of the National Research Council, involved a series of integrated researches dealing with the selection and training of civilian pilots.

Industry.—Where investigations of a decade or two earlier had been focused upon improving the working environment and standardizing the movements of the worker, researches reported in 1939 followed the trend of recent years in stressing the socio-psychological reactions of the worker. The most recent publication from the long-term studies in the Western Electric Company again emphasized the high importance of the social identification of the worker with his work. Reports of this investigation, now spread through three books and a number of articles in professional journals, constitute a volume of evidence to show that shortcomings in the working environment may be more than outweighed by an intelligent company policy adequately grasped by workers who are truly identified with their jobs. Findings based upon an extensive survey in a cocoa works in England served further to verify this basic contention.

As a corollary to these studies of job-satisfaction, efforts to use the most advanced techniques of psychology in selecting workers to fit the openings available were widely reported. In France, eight major laboratories were following a standardized procedure which based its tests upon thorough job-analysis and upon adequate testing of the tests themselves, with results that showed a marked effect in reducing accident-rates. The National Institute of Industrial Psychology in England published accounts of the broad scope of its testing activities, many of which were designed to deal with the more complex aspects of human personality. In the United States, professional meetings brought out numerous papers on specific activities in industrial selection, including reports of progress from the United States Employment Service in its attempts to develop a "horizontal" classification of jobs. A classification of this type will classify jobs in terms of their psychological requirements, cutting across vocational lines in a search for psychological uniformities.

Market Research and Advertising.—With the expenditure for advertising reaching astonishing proportions, an association of advertisers sponsored a volume summarizing the present status of methods that have been proposed for measuring the effectiveness of advertisements. This revealed a half-dozen major methods in current use, each with its ardent sponsors and each with certain

weaknesses that are apparent to an objective observer. The evidence suggests that it is much easier to develop some measure of the influence of a total marketing campaign than to obtain a precise index of the effectiveness of a single advertisement. Methods proposed ranged from the photographing of eye-movements during the reading of a magazine, through checks on the identification of slogans, and included various ways of determining the relative frequency with which typical respondents reported that they read a certain advertisement. In connection with the latter method, initial data were published on the development of a formula to deal with the recognized human tendency to report having read advertisements not yet published. There was a strong suggestion that critical psychologists were moving to abandon the vague term "measuring effectiveness of advertising" in favour of a direct specification of what each particular method actually yielded.

In more than one country, intensive research in these commercial fields brought to a high level of accuracy a purely non-commercial device—the poll of public opinion. Earlier polls had suffered severely from improper sampling, crude wording and inadequate safeguarding in the interpretation of results. When those trained in the precise methods of market research took over the task of sampling public opinion, the gain was at once apparent and the poll today has become a commonplace in the daily newspaper. (See also ADVERTISING; MARKETING.)

Vocational Psychology.—It is apparent from many publications of 1939 that the civilized world at large has recognized a duty to provide aid for its youth in finding suitable employment. Perhaps the most characteristic international note of the year in this field was that of critical self-inspection within the group concerned with vocational orientation. From many centres came critical articles which stressed the need for facing the more important shortcomings of the movement. There was increasing emphasis on the necessity of checking statistically the results of guidance programs, instead of assuming that any program must be helpful. Tests, it was frequently pointed out, are important aids to the counsellor but do not constitute in themselves any more than one aspect of a total program. Studies of youth brought out additional data to show that there is a wide disparity between the vocational choices of youth and the vocational opportunities available. Many counselling centres reported specific findings to demonstrate that vocational maladjustment can be markedly reduced by a long-term program, adequately safeguarded and conceived in the light of local opportunities under existing national and international conditions. (See also PSYCHOLOGY.)

Public Health Engineering. Air Sanitation.—Increasing interest continues to develop in the physiological aspects of ventilation of enclosed spaces as contrasted with the purely physical conditions. At Yale university systematic studies of the physiological reactions of subjects to modification of each of the basic physical factors, temperature, humidity, movement and radiation to surrounding walls, are being continued. An attempt has been made to fix the physical limits of the rather intangible property "pleasantness" in a room air. Within the region of ordinary home and office conditions, pleasant-

ness seems to be closely associated with skin temperature and this in turn with certain relations between air temperature and surrounding wall temperature (radiation effect). The relative humidity within this region has little effect upon the sensation of pleasantness.

A somewhat different approach to this question is made by Bedford and Warner of the Industrial Health Research Board and London School of Hygiene and Tropical Medicine. Essential conditions to a feeling of freshness are found to be lower rather than higher temperature, humidity not over 70%, air movement variable rather than fixed, both as to direction and velocity, walls cooler than air, and freedom from objectionable odours. Neither the ordinary changes in electrical conditions (ionization) nor the presence of small quantities of ozone affect the sensation of freshness.

The sterilization of air by the use of ultra-violet light is being rather rapidly developed in the direction of hospital wards and operating rooms, cold storage rooms for the prevention of mould growths and other commercial uses.

Housing.—Present interest in housing lies in the financing and sociological aspects although sanitation plays a large part in the housing problem. In contrast to the emphasis now so frequently placed upon artificial illumination, even to the suggestion of windowless homes and factories, this report emphasizes the importance of orientation and fenestration of buildings with respect to natural daylight. The sun's rays provide thermal, visual, physiological, psychological, and bactericidal effects.

Water Supply.—*Bacillary Dysentery.* With the general improvement of the water supplies of the world, there appears to be increasing evidence of water-borne bacillary dysentery, presumably previously masked by the high rates of typhoid and para-typhoid infections. The Office of Public Hygiene (League of Nations) reports continued increase in reported cases in Great Britain since 1934, mostly of the Sonne or the Flexner type. In the U.S., minor outbreaks are reported with increasing frequency.

A committee of the American Water Works Association in a preliminary report indicates the frequency of water-borne outbreaks, most of which have resulted from inadequate protective devices or improper control methods.

Ozone.—Renewed interest in ozonization of public water supplies is indicated in a paper before the Inst. of Water Engineers by George Baxter and by the subsequent discussion. When electrical energy is not too costly ozonization appears to be preferable to chlorination on several grounds.

Fluorine and Dental Caries.—Interest in the significance of fluorine in water supply, as a cause of a dental disfigurement known as mottled enamel, has been increased by a recent publication of Dean, *et al.*, who find on the basis of extensive studies in Illinois (U.S.), that fluorine appears to be partially preventive of dental caries.

Sewage Treatment.—A significant trend of the time in sewage treatment is a return to the long abandoned aim of valuable by-product recovery. At present, not only is sludge recovered as a useful and valuable by-product but, what is more important, power is being generated from the sludge digestion gas in sufficient quantity for pumping the sewage, heating and lighting the premises, and, at times, for aeration, the most expensive item in the activated sludge process. A further development has recently been announced in Middlesex county, England, whereby this gas is being compressed in cylinders and utilized in motor vehicles. The Mogden treatment plant produces over 150,000 cu.ft. of methane per day, equivalent to about 700 imp. gal. of gasoline and having a value, under present conditions, of about \$95,000 a year.

Aviation and Mosquitoes.—The International Health committee has had under consideration the possibility of the transportation of Aedes mosquitoes by aeroplane. In a study of planes arriving at Durban, Natal, Ross reports the recovery of live mosquitoes in 28 out of 84 planes examined, after routine treatment with oil spray. He concludes that there is definite danger of introducing yellow fever by this route.

Recreational Use of Natural Facilities.—In the U.S. many new problems in sanitation have arisen through the use of the "trailer," a house on wheels carried about the country behind an automobile and detached for overnight or more lengthy stops at trailer or road-side camps or elsewhere. So popular has this type of vacation convenience become that elaborate arrangements are provided for them in the form of camp grounds, and local authorities have promulgated special rules and regulations for their control. Minimum requirements are a suitable water and milk supply, adequate waste disposal, drainage, toilet, bathing and laundry facilities. The spread of disease is facilitated by these constantly interchanging groups and its prevention calls for special diligence.

An allied problem is the recreational use of public land in general and in particular of water-shed areas serving public water supplies. The desirability of permitting bathing, boating or fishing in or upon reservoirs is being more frequently debated, and has recently been dealt with in a symposium of papers before the American Water Works Association.

Gorbage and Waste Disposal.—The ever present problem of garbage and waste disposal is apparently being studied with renewed activity in many places, despite the favourable and almost general acceptance of high temperature incineration—the principal objection to which appears to be its cost. At Manila, a serious fly nuisance has resulted from the practice of dumping despite all precautions, and the monthly *Bulletin of Health* recommends a study of the Baccari system (fermentation). In the U.S. the latter system has been tried experimentally but the only definite trend

NEW SEWAGE DISPOSAL PLANT at Talmann's Island, New York city, as viewed from the air in Feb. 1939

away from incineration has been in the direction of the "sanitary fill" method. This consists in dumping in prepared areas and quickly covering and compacting under several feet of soil, generally excavated from a pit ahead of the dumping face. This process is being extensively developed in New York city. It appears to be quite successful except for slight local objection.

Hog feeding, the other American practice, appears to be definitely associated with human trichinosis. In a recent survey Wright finds indications of a widespread, sub-clinical infection, trichinae having been found in about 17% of 3,000 human diaphragms from routine hospital autopsy. The rate among Jewish cases (134) was 0.7%.

Further evidence against the feeding of garbage is found in a study of Feldman on tuberculosis in garbage-fed swine. Examination of 264 such carcasses resulted in a finding of 75 with tuberculosis lesions. From these, 47 cultures of tubercle bacilli were recovered, 35 of the avian type, and 12 of the human type.

It is indicated that tuberculous poultry are perhaps of more common occurrence than has been generally recognized and that city garbage has certain hitherto unverified if not unsuspected potentialities for disease transmission.

Public Health Services. Countries with highly centralized powers have highly centralized health organizations, with supreme authority in all health matters, while in other countries, such as the United States of America, for example, local health powers are retained by the constituent States or provinces. Recent advances made by the various public health services follow a similar pattern, and relate principally to the improvement and expansion of present health administration, better training of public health personnel, intensified attacks on specific diseases, the adoption of nutrition as a public health problem, greater attention directed to infant, maternal and child care, and the enactment of some form of health security legislation.

While the health services of the various countries continue the basic public health activities of quarantine, environmental sanitation and immunization procedures, they are expanding the scope of their public health activities. Facilities for special training courses are being provided by the public health services of many countries.

In certain parts of Europe symptoms of dietary deficiency diseases are reported among the rural populations. The appearance of cases of night blindness and skin affection attributable to vitamin A deficiency has been noted among the rural population of several countries, and rickets is reported to be wide-spread in the children of these populations in southern Europe. Dietary surveys were being made in 1939 by the health services in Great Britain, Belgium, Finland, France, Hungary, Norway, Sweden and Yugoslavia. The United States Public Health Service and State and local departments of health of that country are devoting attention to nutrition. The recognition of the ill effects of an inadequate diet in the health of pregnant and nursing women, on the normal physical development of children, and possibly on resistance to disease has resulted in the development of a program of nutrition education. In 1939 the United States Public Health Service reported the discovery of a new vitamin (riboflavin) de-

ficiency disease in man which had probably existed in the United States for many years.

A national health survey made in the United States reported in 1939 that more than 800,000,000 days of disability were occurring annually as the result of chronic diseases. The public health services of several countries are directing greater efforts to discover the aetiology of such diseases as cancer and rheumatic heart disease.

In many countries the public health services are attempting to secure a wider dispersion of health, medical and hospital facilities, and various forms of health insurance and collective medicine have been adopted. It cannot be said that they have all been successful. The British Ministry of Health reports that the Insurance Medical Service was working satisfactorily in Great Britain. By an act which became effective there in 1938, young persons 16 years of age and over became eligible for the benefits of the service, increasing by approximately 1,000,000 the number of persons entitled to the services of their chosen doctor, as was previously the case with their elders. The number of persons covered by health insurance in England and Wales was about 18,000,000 in 1935.

In western Canada the "municipal doctor" system has been found to work efficiently. The municipal doctor is paid a salary and is allowed to make charges for services to non-residents. It is said that he makes an ideal health officer because he finds it to his advantage to use to the fullest extent possible all preventive measures.

The French physicians maintain that the system adopted in France of providing medical care and hospitalization is abused by persons well able to pay for such services and that the indemnities allowed by the social insurance system for sickness and maternity cases are insufficient. A bill has been introduced providing for stricter control of hospital admissions.

The proposal for a national health insurance scheme in Australia was abandoned in 1939 because of the fear that the financial burden would stifle normal development, as it came simultaneously with an enlarged defence program, and also because of the general unpopularity of the act. The 1938 Social Security Act of New Zealand provides for medical services and indemnification for sickness.

The Public Health Service of the United States proposes Federal aid to the States for medical and hospital care and is already giving assistance to the States through Federal grants-in-aid for preventive medicine. These grants-in-aid are for strengthening and expanding State and local health services and improving the technical qualification of their personnel. Many State health departments have created special divisions of industrial hygiene and venereal disease control, have intensified efforts directed to the control of such diseases as tuberculosis and pneumonia, and have increased the number of full-time health services in rural areas by more than 130%. Adequate treatment for venereal diseases is being brought within the reach of more patients, clinical facilities are being expanded, and a larger number of syphilitic patients are being brought under treatment in the early stages of the disease when the outlook for cure is most favourable. During

the fiscal year 1939 approximately \$10,500,000 of Federal funds was allotted to the States for the improvement of their health services.

In France, the use of toxoid against diphtheria is reported successful over a period of several years, and it is stated that the disease has practically been eliminated in the French Army. A law making diphtheria vaccination in school children obligatory was promulgated in France in 1938 and a similar law is in effect in Hungary, Rumania and the city of Geneva, Switzerland (also in Poland before the occupation of that country).

In Germany, advance in public health services in 1939 was signalized by the expansion of infant welfare work, provision of examination and consultation service for school and preschool children, including dental service which theretofore had been reported as unsatisfactory, X-ray examination, and increased facilities for the control of the venereal diseases and mental conditions. Reports of the Division of Public Hygiene (Ministry of the Interior) reveal considerable prevalence of postural defects, scoliosis and flat foot in preschool children. Germany is also conducting a campaign against the excessive use of alcohol and tobacco, said to be the result of extensive and seductive advertising, and is intensifying its efforts in the prevention of drug addiction.

Advance in public health services in the Latin American Republics is represented by a number of outstanding developments which reflect the attention being given to public health by the governments and the people. New Ministries of Public Health have recently been created in Bolivia, Brazil, Colombia, Panama, Paraguay, Peru, Uruguay and Venezuela. Expansion in public health service activities are represented by wide-spread development of health centres, the extension of laboratory service, nutrition studies and greater attention to the problem of proper diet, training of public health personnel, increase in full-time health services, creation of services for public health education, improvement in vital statistics, including disease reporting and intensified efforts directed against specific diseases. Legislation providing compulsory health and social security insurance was enacted in Ecuador and Peru, and existing provision for such insurance was amplified in Chile. Increased appropriations for public health services were made by most Latin-American countries in 1939.

The health services of many countries are taking a greater interest in housing as a health problem. Great Britain has developed a progressive housing program; and of approximately £1,250,000 asked for social services in Ireland £800,000 is for housing and approximately £450,000 is for health services. Public Utilities. Legislatively, the year 1939 was much less significant than the preceding years of "New Deal" influence, the era of legislative expansion and reorganization of public utility regulation having apparently come to a close. The only significant piece of Congressional legislation was an amendment of the Tennessee Valley Authority Project Act which expanded the borrowing capacity of this public corporation in order to enable it to pay its share of the acquisition price of privately owned public utility properties in the valley region. As indicative of the tendency in public policy to call a halt in the

process of reorganizing State regulatory commissions, the failure of the long drawn out attempt to abolish the Public Service Commission of Wisconsin, replacing it with an Administrator and a species of administrative court, should be recorded. Fresh periodic attempts to set up a State commission for public utility regulation were defeated in Texas and Florida.

Administrative commissions both State and Federal, continued to turn out the annual grist of investigations, opinions and orders. The Federal Power Commission, under the Natural Gas Act of 1938, began an extensive investigation of natural gas rates in Colorado, Wyoming and New Mexico. Little progress, however, has as yet been made by the Securities and Exchange Commission in working out the physical integration program under section 11 of the Public Utility Holding Company Act of 1935. On the other hand, the commission has made notable progress in the simplification of holding company financial structures on a voluntary basis.

While the grist of actual legislation was small, important investigations and reports concerning public utility matters were initiated or concluded during the year. In April a congressional committee investigating TVA operations made a majority and minority report, giving the country directly opposite conclusions. Speaking generally, the majority upheld the present functioning of the board while the minority accepted the criticisms of the board's former chairman, A. E. Morgan, besides developing several of its own. On the question of administrative autonomy, the majority would merely eliminate control by the General Accounting Office, substituting what it regarded as more suitable audits by a private auditing firm responsible to Congress. The minority, however, recommended a complete reorganization of activities with the return (1) of agricultural functions to the Department of Agriculture, (2) of dam construction and operation and river regulation to the War Department, (3) a revamped TVA board of five directors retaining merely the marketing of wholesale power under local and Federal regulation and taxation as would be the case with private enterprise. On the very contentious yardstick issue, which the TVA exemplifies more than any other agency, the majority contended "that the electric rates of the Authority provide a legitimate, honest yardstick of equitable rates of private industry" while the minority held that the word "yardstick" should be stricken once and for all from the TVA vocabulary. The most reassuring finding that private industry can extract from the report is probably the conclusion that the TVA will not be able with its present or prospective supplies of power safely to expand beyond its present service area. (See also TENNESSEE VALLEY AUTHORITY.)

Another committee, the National Defense Power committee, with Mr. Louis Johnson, assistant secretary of War, as chairman has been at work since Sept. 1938 to investigate the total power production capacity of the United States. Because the World War (1914–18), with its increased power demand for munitions and other purposes developed a serious power shortage, this committee is required to study the problem as a phase of the general problem of national defence and to recommend steps to assure a plentiful supply. In this connection needed links in the transmission network are especially important.

Another important committee, or rather renewal of an older committee, is the National Power Policy committee. Under the chairmanship of the secretary of the Interior, Mr. Ickes, this group is also to report on existing power capacity and transmission facilities and to project the requirements into the future, studying means, both public and private, of alleviating any shortages or inadequacies. In this connection a technical report suggesting something approaching a British Grid system for the United States has been much discussed but no definite recommendations are as yet available.

Certain preliminary figures of the census report on electrical industries for 1937 have become available showing changes in number of customers, sales in kilowatt hours and revenues for the year. Judicially, more than usual interest attaches to the dismissal by the United States Supreme Court in January of certain utility suits against TVA. This decree may be said to constitute the concluding action in the long campaign on the part of private utilities to thwart the power production and power marketing program of the Federal Government as incidental to its nation-wide program of river regulation in the interests primarily of navigation and flood control.

In April the highest court reversed a statutory district court in the so-called "York Case," where that court had granted an injunction against a temporary rate reduction order of the Pennsylvania Public Utility Commission. Because the commission had not made a finding of "fair value" in accordance with former decisions of the Supreme Court but had avowedly based its decision on historical investment cost, the lower court considered the temporary rate-fixing procedure as confiscatory. The Federal Supreme Court, however, while not definitely overruling the leading case of *Smyth v. Ames* of 1898 as demanded by Justices Frankfurter and Black, found that there had been presented no compelling evidence to sustain confiscation. This decision is hailed by many as the first step in the final approval by the revamped Supreme Court of the "prudent investment" basis of public utility rate regulation.

There remains only to record the facts regarding the substantial completion of the Tennessee Valley Authority's purchasing program, designed to bring about peaceful relations between the Federal Government and the private utility industry in the Southwest. Combined with certain earlier purchases of transmission lines, substations and distribution systems of the Mississippi Power company and Alabama Power company in 1934 and 1936, the current purchases with a few minor supplementary acquisitions are designed to give the TVA and its public and co-operative distributors complete control of the market in an area comprising practically the entire State of Tennessee, the northern tiers of counties in north-eastern Mississippi, northern Alabama and north-western Georgia.

The table gives the amounts involved:

Seller	Total price	TVA payment	Contractors' payments
Tenn. Public Service Co.	\$ 8,035,000	\$ 2,551,500	\$ 5,483,500
Memphis Power & Light Co. . . .	17,360,000	2,110,000	15,250,000
Miss. Power Co.	2,000,000	1,333,000	667,000
Tenn. Elec. Power Co.	78,600,000	44,500,000	34,100,000
	\$105,995,000	\$50,494,500	\$55,500,500

In accordance with TVA policies, the above purchases give the Federal agency complete control over all power producing facilities, both steam and hydro, operating in the area together with all major interconnecting transmission facilities, enabling it to serve the local distributing utilities with which it has contracts for the supply of power at wholesale rates. The Oct. 1939 report showed that TVA was supplying all the power requirements of 63 cities, 29 co-operatives, 2 private companies, 11 temporary operating districts and Government reservations. The monthly output is resold to 354,540 customers of all classes and represents 596,446,121 kw. hours. The importance of these arrangements is that it may point the way in which the output of other Federally promoted power supplies will be absorbed as these projects go into production.

Publishing. The American book trade enjoyed a relatively prosperous year in 1939, although the number of new books and new editions decreased about 4% from the total of 1938. Inexpensive editions were published in greatly increased quantities, and one newcomer in this field successfully introduced paper-bound reprints to sell at retail for 25¢. Table I, prepared by *The Publishers' Weekly*, gives the comparable figures of book production for 1939 and 1938 in the various international classifications.

Table I.—U.S. Publications

Among the domestic events favourable to publishing in 1939 was continuation of the 1½¢ postage rate on books for two more years, until June 30, 1941.

Best Sellers.—The most popular book of 1939, fiction or non-fiction, was John Steinbeck's *The Grapes of Wrath*, which according to the percentage analysis of *The Publishers' Weekly*, had a sale of more than 300,000 copies. Rachel Field's *All This and Heaven, Too*, first published in 1938, was second among novels in 1939 with 107,780 copies printed, and Daphne du Maurier's *Rebecca*, another 1938 publication, was third with 162,300. Other works of fiction in the order of their sales in 1939 were *Wickford Point*, by John P. Marquand; *Escape*, by Ethel Vance; *Disputed Passage*, by Lloyd C. Douglas; *The Yearling*, by Marjorie Kinnan Rawlings (published in 1938); *The Tree of Liberty*, by Elizabeth Page; *The Nazarene*, by Sholem Asch; and *Kitty Foyle*, by Christopher Morley. The last two novels were published in October and therefore their sales are not strictly comparable with those of books published earlier in the year. *Escape* was published in September.

The sale of non-fiction reflected public pre-occupation with international events. First on the list of best sellers in 1939 was *Days of Our Years*, by Pierre Van Paassen (230,000 copies sold). Second was *Reaching for the Stars*, by Nora Waln, and third, *Inside Asia*, by John Gunther. Others were *Autobiography with Letters*, by William Lyon Phelps; *Country Lawyer*, by Bellamy Partridge; *Wind, Sand and Stars*, by Antoine de Saint Exupéry; *Mein Kampf*, by Adolf Hitler; *A Peculiar Treasure*, by Edna Ferber; *Not Peace But A Sword*, by Vincent Sheean; and *Listen! The Wind*, by Anne Morrow Lindbergh, published in 1938.

Great Britain.—September, ordinarily one of the busiest months for the English book trade, was one of the poorest within memory; the coming of war virtually stopped all activity in the business. But public attention was soon directed to the virtues of reading as a diversion from unpleasant realities—a "lenitive," as one observer put it. By the first part of October normal conditions were restored, and provisional estimates indicated that retail sales

in the last three months of 1939 were not far below those for the last three months of 1938. Table II, compiled by *The Publishers' Circular*, London, shows the number of new books and new editions which appeared during 1939.

Other Countries.—The number of new books and new editions published in France in 1938 was 15,894; in Italy, 10,648. The production of European works in German in that year was 25,439. Russia's production in 1936 (the last year for which statistics were issued) was about 42,000 books and pamphlets. (J. V. Do.)

Puerto Rico, a United States insular dependency in the West Indies; languages, English and Spanish; capital, San Juan; governor, Rear-Admiral William D. Leahy. The area is 3,435 square miles. The population by the 1930 census was 1,543,913, and was officially estimated at 1,805,480 in 1938. In 1930, 25.7% of the population was Negro. The chief cities (with 1935 estimated populations) are: San Juan, 137,215; Ponce, 60,867; Mayagüez, 44,907.

History and Government.—Puerto Rico is governed by a governor appointed by the President of the United States and an elected bicameral legislature.

On Sept. 11, 1939, Rear-Admiral William D. Leahy (retired) assumed the governorship, succeeding Brigadier-General Blanton Winship, governor since 1934.

The appointment of Admiral Leahy, a specialist in naval strategy, was closely connected with measures looking toward the development of Puerto Rico as a major cog in the United States Caribbean defences of the Panama canal. On July 1, a new military department of the United States, the Department of Puerto Rico, with headquarters in San Juan, was created. San Juan, according to the new policy, is to serve as one of the great strategic centres in the Atlantic, with aviation bases, modern coast defences, and anti-aircraft guns, and as a general base of supply for military and naval operations throughout the Caribbean. Estimated costs are \$30,000,000. In September, 1,700 additional troops, chiefly anti-aircraft and coast artillery units, were transferred to Puerto Rico and, in October, contracts aggregating \$8,300,000 were made for the construction of a naval air base at Grande island, near San Juan.

In keeping with the new military emphasis on Puerto Rico, the

island was important in the February war games of the United States Navy.

Throughout the year 1939 Puerto Rico continued to face economic difficulties, arising primarily from her overpopulation and from the quota restrictions placed upon sugar, her most important single product. Early in the year Governor Winship officially complained that the island had not received its fair share of relief and rehabilitation appropriations. Business groups within the island placed emphasis upon three major points as essential for restoration of Puerto Rican prosperity: increase of sugar quota, amendment of the United States Wages and Hours Act, and improvement of credit facilities. The sugar quota for 1939 was 851,000 tons, but there was actual cane in the fields ready for cutting and processing sufficient to produce 1,200,000 tons. Quota modification in September, as a result of the sugar panic in the United States temporarily alleviated the situation but did not remedy it. Early in the year Puerto Rico experienced labour troubles as a result of application of the United States Wages and Hours Act. Lower standards and costs of living, it was alleged, necessitated exemptions, and employer groups vigorously opposed the new act. In April, 20,000 sugar factory workers struck for minimum wages of 25 cents an hour. In August it was estimated that 1,000,000 persons, or 65% of the population, were undergoing hardships due to lack of work and of adequate food. The restricted sugar quota compelled closing of sugar mills in May, after the shortest grinding season in 25 years. Governor Leahy reported, shortly after assuming office, that 476,000 were unemployed, and asked aid. For the coffee industry, representing a \$26,000,000 investment in 400,000ac., with 500,000 persons dependent upon it, aid was also asked. To alleviate unemployment a \$100,000,000 Federally financed corporation, to finance agricultural, industrial, and mining enterprises, was recommended by Secretary of the Interior Harold Ickes.

During 1939 marked progress was made in betterment of health conditions, with notable decreases in the malaria and hookworm death rate.

The tourist trade brought 18,917 tourists (more than triple the 1935-36 figure) in the 1938-39 season, besides 28,616 personnel of the United States and foreign war vessels.

Education.—In 1939, Puerto Rico had 1,830 primary schools, with 281,539 enrolment (a slight increase). The University of Puerto Rico (enrolment 4,500), already important as a cultural link between the Americas, is in process of development as a major centre of inter-American cultural exchange. The Eighth Congress of the World Federation of Education Associations was held at San Juan during Aug. 1939.

Finances.—The monetary unit is the United States dollar. The budget for 1938-39 (accounting for slightly more than one-fourth of the total costs of government) amounted to \$14,223,510.14. Bonded indebtedness on June 30, 1939, was \$26,215,000 (\$27,400,000 on June 30, 1938).

Total revenues available in 1938-39 were \$44,496,702.25 (\$44,255,382.41 in 1937-38).

Trade and Communication.—Puerto Rico has regular, daily air transport communications with the United States and southward to Panama. Frequent, regular steamship sailings connect the island with other parts of the West Indies and with the United States. There are 492km. of railways and a main highway system of 1,896km., supplemented by local roads. The insular Government owns and operates 1,900km. of telegraph and 3,157km. of telephone lines (15,171 telephones).

Exports in 1938-39 totalled \$86,486,570 (\$82,077,178 in 1937-38), of which \$84,782,650 went to the United States. Imports were \$82,724,182 (\$93,314,783 in 1937-38), of which \$75,684,719 were from the United States.

Agriculture and Manufacturing.—Puerto Rico is primarily agricultural. Sugar (1,703,938,000lb. in 1938-39) accounts for 70% of the income. Coffee (23,498,000lb. in 1939-40) is largely for local consumption. Tobacco (11,688,384lb. in 1938-39) and tropical fruits, especially grapefruit and pineapple, are also important. Manufacturing is limited, but rum (supplying two-thirds of the United States demand), cigars, canned fruit and fine embroideries are important. (L. W. BE.; M. H. B.)

Pugilism: see BOXING.

Pulitzer, Ralph (1879-1939), American publisher, was the eldest son of Joseph Pulitzer, one of America's most distinguished journalists. He was born in St. Louis, Mo., on June 11 and was educated during his youth by private tutors. After four years of travel abroad he entered Harvard, where he graduated in 1900. Immediately thereafter he began his journalistic career on *The New York World*, the famous liberal daily founded by his father. When Joseph Pulitzer died in 1911, Ralph Pulitzer became president of the Press Publishing company, which published both the *World* and the *Evening World*. His younger brother Joseph Jr., inherited the other crusading Pulitzer paper, *The St. Louis Post-Dispatch*. Ralph Pulitzer remained as publisher of the *World* until it was sold in 1930. In 1934 he was administrator of the newspaper code under the NRA. He died in New York city on June 14.

Pulp Industry: see PAPER AND PULP INDUSTRY.

Pumice. A silicate of aluminium, of volcanic origin, pumice occurs as lumps or gravel, and also as volcanic dust, known as pumicite. Pumice is produced in the United States in California and New Mexico, and pumicite in Kansas, Nebraska, California, Oklahoma, and Oregon with a total output of 65,742 short tons in 1938. About 71% of the output is used in cleaning and scouring compounds and hand soaps, 12% in the production of light-weight concrete, and 5% for acoustic plaster. Pumice is also produced extensively in Italy (about 100,000 metric tons annually), and in Greece, imports from both of these sources being used in the United States. (G. A. Ro.)

Purdue University, at Lafayette, Ind., is Indiana's Land Grant institution, created under the Morrill Act of Congress of 1862, granting to each State public lands for the establishment of a university for the teaching of "agriculture, science, and the mechanic arts." Enrolment as of Oct. 1, 1938, was 6,778, divided as follows: all engineering, 3,611; agriculture, 829; pharmacy, 162; science, 791; home economics, 791; physical education, 132; graduate students, 421. This is a gain of practically 10% over the previous year. For some years Purdue has had the largest engineering enrolment of any institution of higher learning in America. The faculty and staff numbers over 900.

Research work of the university is being constantly expanded in the fields of agriculture, engineering, science and pharmacy. New studies of importance in nuclear physics have been started with the cyclotron or "atom smasher"; commercial exploitation of the fundamental research of the nitration and chlorination of hydrocarbons has proven unusually productive during the year; basic research has been undertaken co-operatively with both private corporations and governmental agencies in aeronautics, radio, and television; 50 of the 330 college and university students who were trained in the spring of 1939 in institutions of higher learn-

ing were trained and licensed at Purdue on the university airport of 208ac.; 50 more were trained in the autumn of 1939.

During 1939, four more units were added to the men's residence hall group, providing living quarters for 1,060 men; a third unit was added to the women's residence halls, bringing their capacity to 400. The new building for the School of Chemical and Metallurgical Engineering was occupied in the autumn of 1939 and the new music hall and auditorium with a seating capacity of 6,207, is scheduled to be dedicated toward the end of the 1939-40 academic year. The additions to the Memorial Union building, almost doubling the capacity of that structure, were occupied in Jan., 1940. Buildings on the campus and adjoining farms now number 72.

PWA: see HOUSING.

Pyrite or Pyrites. World production of pyrite in 1936 reached 8,700,000 metric tons, slightly more than the 1929 high, after having dropped to a low of 5,700,000 metric tons in 1932. Spain was the leading producer, having furnished 51% of the output in 1929, 37% in 1932, and 27% in 1935. In 1936 operation of the largest Spanish mines was seriously interrupted by the civil war when the region was occupied by the rebel forces. Among other producers, Japan has a rapidly increasing output that ranked second in 1934 and 1935, and has possibly stood in first place since then. In the next rank of producers with outputs of 500,000-1,000,000 tons, are Norway, Italy, the Soviet Union and the United States; in the 100,000-500,000 ton group are Cyprus, Germany, Portugal, France, Greece, Canada, and Sweden, and a number of others have still smaller outputs. With no data available from Spain, Japan, and the Soviet Union since 1935, no estimate can be given on current world output.

The United States output of 564,500 metric tons in 1938, a 5% decrease from 1937, was insufficient to meet the demand, and was supplemented by imports of 340,000 tons, almost entirely from Spain. Partial data for 1939 indicate a rise of about one-quarter in imports.

British production of pyrite is insignificant (4,700 long tons in 1937); Australia, Southern Rhodesia and South Africa have outputs of 20,000-30,000 tons; there is no direct production in Canada, but by-product concentrates were recovered from copper ores and sulphur and sulphuric acid were produced from smelter gases, containing a total of 112,400 short tons of sulphur content in 1938, equivalent to about 225,000 tons of pyrite. (G. A. Ro.)

Quebec, one of the original Provinces of the Dominion of Canada; area, 594,534 sq.mi.; population, according to the Dominion census of 1931, 2,874,255, estimated Jan. 1, 1940, 3,172,000. Capital, Quebec, 130,954. The only city with larger population is Montreal, 818,577. Of the Province's population 1,813,606 are urban, or 63%; 2,696,122 native born; only 178,133 foreign born.

Two types of trade unions are found in Quebec; the National Catholic Unions and the older International Unions. The former have a membership of about 57,000, while the membership of the latter is 59,000. The net value of production in the province for 1936 was \$656,952,315, an increase of 8% over the preceding year. The gross value of agricultural products in 1936 was \$111,742,408, of manufactures \$377,514,998, a decrease of 4% from the preceding year.

The Union Nationale Administration of the Hon. Maurice Duplessis was defeated in Oct. 1939 and the Liberals were returned to power with the Hon. A. Godbout as premier and attorney-general. The standing of the different parties at the present time

(1940) is as follows: Liberal, 68; Union Nationale, 16; Independent, 1, and National 1. The Hon. E. L. Patenaude is the lieutenant-governor. Quebec is represented in the Dominion Parliament by 24 Senators who are appointed for life and by 65 members of the House of Commons who are elected for five years or less.

BIBLIOGRAPHY.—*Statistical Year Book; Annual Report of the Provincial Secretary and Treasurer.* (J. C. HE.)

Queensland (Australia).—Area 670,500 sq.mi.; pop. (est. Dec. 31, 1938) 1,004,150. Chief towns (pop. Dec. 31, 1938): Brisbane (325,890); Rockhampton (32,526); Townsville (31,414). Governor: Sir Leslie Orme Wilson, G.C.S.I., G.C.M.G., G.C.I.E., D.S.O.

History.—On August 18 Mr. Forgan Smith's tenure of office as premier became the longest in the history of the State, surpassing the record of the late Sir Samuel Griffith. Mr. Forgan Smith has been in continuous office since 1932. Mr. Hynes, minister for labour and industry, died during 1939 and was succeeded by T. A. Foley, while J. Larcombe became minister for mines.

The budget revealed a surplus of £14,046 for the financial year 1938-39, revenue being £19,330,369 and expenditure £19,316,323. A deficit of £64,702 was estimated for 1939-40 but no extra taxation was imposed.

The Motor Spirit Vendor's Act, to encourage the production of power alcohol, compelled gasoline vendors to purchase two gallons of power alcohol for every 100 gal. of motor spirit sold.

The governor's speech at the opening of parliament on August 8 reviewed the steady growth in the prosperity of the State during recent years. Total production during the year 1938-39 was valued at £68,136,000, and was the greatest ever recorded. Primary production and factory production showed increases of 2.8% and 11% respectively over the past 10 years, and unemployment a decrease from 22.2% in 1932 to 4.2% in 1939.

Rate of population growth was greater than in any other State, and the national income had increased by 11.3% since 1929.

Overseas exports direct from Queensland ports constituted a record.

In July the Premier opened the new outer harbour at Mackay, which had taken five years to build and had cost £1,000,000.

(L. R. Mc.)

Education.—In 1936: schools 1,956, scholars 201,514.

Banking and Finance.—Revenue (1938-39) £A19,330,369; (est. 1939-40) £A20,310,735; expenditure (1938-39) £A19,316,323; (est. 1939-40) £A20,347,437; debt outstanding (June 30, 1939) £A127,503,241.

Communications.—In 1938: roads, motor 37,955 mi.; railways 6,567 miles. Motor vehicles licensed (June 30, 1938): 72,407 cars and taxis; 38,555 commercial; 7,846 cycles. Wireless receiving set licences 117,487. Telephones 58,626.

Agriculture, Manufactures, Mineral Production.—Production in 1937-38: sugar, cane 763,242 tons; wheat 3,749,000 bu.; maize 2,628,000 bu.; wool 174,751,000 lb.; gold (1938) 151,432 fine oz.; silver (1938) 3,533,490 oz.; coal 1,113,426 tons. Industry, manufacturing, 1937-38: factories 2,995; employees (average) 51,391; production, net value £17,933,752.

Rackham, Arthur (1867-1939), British artist whose illustrations for children's books were known throughout the English-speaking world, was born September 19; for his biography and list of his earlier works, see *Encyclopædia*

Britannica, vol. 18, p. 873. Among the works illustrated by him in his later years were *The Vicar of Wakefield* (1929), *The Night Before Christmas* (1931), *The Compleat Angler* (1931), *Auderssen's Fairy Tales* (1932), *The King of the Golden River* (1932), *The Pied Piper of Hamelin* (1934), and *Peer Gynt* (1936). He also published *The Arthur Rackham Fairy Book* (1933). He died at Limpsfield, Surrey, England, on September 6.

Radio, Industrial Aspects of. Despite the sharp increase in broadcast revenue during 1939—marking still another year in which the youthful medium of radio set a dollar-volume record—the industry, as a whole, made more history in fields indicative of coming maturity than in fields (such as revenue records) which are primarily the playground of youth. In this respect, three trends are worthy of emphasis: (1) the trend toward bigger investments, not only in technical equipment, but also in personnel, wages, publicity, general operations, and in experimentation; (2) the rapid upsurge in unionism; and (3) the desire to maintain continued friendly relations with the listening public by means of self-imposed policies governing programs and advertising.

Revenue and Finance.—*Revenue, 1939.*—Not until the summer of 1940 will the official broadcast revenue figures for 1939 (receipts from advertising and allied sources) be released by the Federal Communications Commission. However, fairly accurate estimates can be made in the interim on the basis of certain trade indices whose mechanics need not be discussed here. Such indices show that net broadcast revenue—that is, revenue after all trade discounts—rose about 12% over 1938. Meantime gross revenue—that is, revenue prior to discounts—over-reached 1938 by around 13%.¹ The major networks had an especially good year, their gross receipts soaring 15.6%. This situation may be summarized as follows:

	1939	1938
Network gross receipts from sale of time	\$ 83,000,000*	\$ 71,728,400
Total industry net receipts from sale of time	131,500,000(?)	117,379,459
Total industry gross receipts from sale of time . . .	165,000,000(?)	143,500,000

*The networks' best commercial customers were tobacco manufacturers, drug manufacturers, food producers, and the makers of soaps. The automotive industry, once a leading buyer of radio time, did not spend nearly as much during 1939 as in prior years.

At this writing, however, it does not seem probable that profits rose as rapidly as income. Between 1937 and 1938, for instance, the expenses of the industry increased \$1,000,000 while advertising income was showing only dubious gains. Subsequently, wage costs and outlays on technical experimentation have been greatly accelerated, indicating that profits probably are not keeping pace with revenue.

Distribution of Profit.—If past Federal Communications Commission analyses anent the distribution of profits will hold true for 1939, then anywhere from 64% to 71% of the 700 U.S. commercial stations will show a profit, while between 29% and 36% will have expenses in excess of revenue. The generic difference between profitable and losing stations is that the latter usually lack network affiliation, operate on limited time, are situated so that economic support is difficult to obtain, or have problems of delivering a proper signal.

Singly, or in combination, these factors conspire to make a station lose money. On the other hand, aggregate losses by this group have never been alarming. In 1938 (official figures for which were released in the summer of 1939), such deficits amounted to only \$2,223,195, while the 419 stations in the profit category showed an excess of revenue over expenses of \$16,728,533 prior to

¹Magazines, newspapers, and other media compute their annual dollar volume as "gross." The FCC computes radio income as "net." Hence, the broadcast industry is in the habit of using two income figures—one for comparative purposes with other media and one for FCC purposes.

Federal taxes. If network profits are added, the aggregate industry profit for 1938 totalled \$18,854,784 prior to Federal taxes.¹

Radio v. Other Media.—There was continued evidence in 1939 that radio's acceptability as an advertising medium was still growing. Compared to the 12% rise in broadcast revenue, the performances of newspapers and magazines in the advertising field were far less spectacular. Broadcast revenue also compared favourably with indices on general business activity. Projections by J. A. Livingston, *Business Week* economist, on the "Business Week Index of Business Activity" indicate a 24% average gain in 1939 over 1938. However, since this index is largely based on industrial production—not on sales—radio's 12% increase may be assumed to be comparatively good.

Programming.—Programs, or entertainment and information, are broadcasting's primary reason for existence and the *sine qua non* of economic support from advertisers. During 1939 the programming structure was perceptibly altered. From the network viewpoint, changes in the content of evening hours centred chiefly around a deflation of formality, accompanied by an increase in such program types as drama, tests-contests (quiz programs, etc.) and news. On network daytime schedules, an ironclad domination was again exercised by the "strip serial"—a form of "heart throb" dramatic presentation akin to the cartoon strips in newspapers.

Network Evening Programs.—Statistically viewed,² the 1939-40 season which began in September compares as follows with the 1938-39 season which concluded in May (commercial programs only are tabulated here because they are in the great majority):

Type of program	1939-40 Pct. of Total	1938-39 Pct. of Total
1. Variety	35.52%	40.76%
2. Drama	18.40%	17.36%
3. Tests and Contests	16.45%	11.02%
4. Straight Popular Music	8.17%	9.98%
5. News	5.55%	4.02%
6. Comedy Teams (Amos 'n' Andy, etc.)	3.42%	2.98%
7. Classical Music	3.34%	2.04%
8. Semi-Classical Music	2.62%	2.99%
9. Familiar Music (ballads, waltzes, etc.)	2.55%	2.55%
10. Religious Programs	1.92%	0.93%
11. Talks-gossip (Walter Winchell, etc.)	1.35%	2.27%
12. Sports	0.71%	2.14%
13. Single Act (one-person variety entertainment)	0.06%

It should be noted that the proportion of dramatic programs is noticeably growing. In fact, this growth is even larger than the mere percentages would indicate, for the only partially completed 1939-40 season is being compared to the cumulative 1938-39 season. The same may be said of news programs and tests-contests.

Network Daytime Programs.—The commercial programs in the daytime category are so uniformly of the dramatic serial type that some concern has been expressed in the industry lest this lopsided schedule alienate listeners. But audience surveys continue to show that the housewife prefers problem-type melodrama to any other kind of presentation. It may safely be concluded, therefore, that the domination of the serial will continue into 1940. Daytime commercial network programs for 1939-40 compare as follows with the prior season:

Type of program	1939-40 Pct. of Total	1938-39 Pct. of Total
1. Serials and Drama	84.92%	76.46%
2. Talks and Instruction	4.54%	10.40%
3. News	3.49%	2.44%
4. Variety	2.33%	4.87%
5. Straight Popular Music	1.50%	0.03%
6. Single Act	1.16%	0.91%
7. Religious Programs	0.62%	1.21%
8. Hymn Music	0.18%	0.31%
9. Classical Music	0.18%	0.63%
10. Tests-Contests	0.17%	0.05%
11. Familiar Music	0.09%	0.12%
12. Novelty	0.39%
13. Band Music

¹The depreciated value of broadcast assets for the industry was \$46,777,987 of which \$11,526,170 was credited to goodwill.

²These tables were especially compiled for the 1940 *Britannica Book of the Year* by the *Variety Radio Directory*. Programs were measured by the amount of time per broadcast per week, multiplied by the number of stations on the network hookup. This method is technically known as the "station hour" method of computation.

Aside from the serials, news programs were the only class which made any appreciable gain whatsoever during the incipient 1939-40 season.

Most Popular Network Programs.—As in the past, the most popular network programs continued to be sponsored programs. Despite frequent demands that the network give more free time to programs of a purely educational, informative, or instructive sort, such non-commercial fare never commands more than a very small audience. In the following tabulation the most popular programs as of Nov. 1939, are compared with the most popular programs of the year before. The ranking is in exact order of popularity, and was compiled by the Co-operative Analysis of Broadcasting, the industry's major fact-finding body in the field of program preferences:

Nov. 1939	Nov. 1938
1. Chase & Sanborn Program (Edgar Bergen, Dorothy Lamour, etc.)	1. Chase & Sanborn Program.
2. Jack Benny.	2. Jack Benny.
3. Lux Radio Theatre.	3. Lux Radio Theatre.
4. Kraft Music Hall (Bing Crosby).	4. Kraft Music Hall.
5. Fibber McGee & Co.	5. Rudy Vallee.
6. Major Bowes.	6. Town Hall Tonight
7. Pepsodent Program (Bob Hope).	7. Al Jolson.
8. Kate Smith Hour.	8. Big Town (Edw. G. Robinson).
9. Fitch Bandwagon (guest orchestras).	9. Major Bowes.
10. Kay Kyser.	10. Burns & Allen.
11. Good News (Edward Arnold, Fannie Brice, etc.).	11. Eddie Cantor.
12. One Man's Family.	12. Good News.
13. Town Hall Tonight (Fred Allen).	13. One Man's Family.
14. Burns & Allen.	14. Hollywood Hotel.
15. Pot of Gold (Florence Heidt).	15. Kate Smith Hour.

This individual program comparison again repeats the story told in previous statistics—contests and quizzes are much in favour; and informality is gaining the upper hand over 1938's elaborately stylized productions. One other factor should be emphasized—programs 30 minutes in length are enjoying more favour comparatively than programs 60 minutes in length. This presages a trend toward shorter programs in 1940, accompanied by still less formality, and possibly a reshuffling in the ranks of the "name stars." It undoubtedly also presages a partial trend away from the extremely high production expenses of 1938's "glamour hours."

The fact that no news program or commentator shows up in the first 15 rankings should in no way result in an underestimation of this type of presentation. Spurred by Europe's martial events, plus the coming U.S. presidential election, news has again marched rapidly to the fore. Indicative of how this trend toward news and factual information may be coupled with informality and the public's desire to participate in a test, or quiz, is the "Information, Please" series. The continued favourable reaction from press and public has made this a unique and noteworthy program, as well as the pattern for many similar productions.

Individual Station Programming.—Less spectacular than network programming, the efforts of individual stations during 1939 were none the less based on sound values. Music, news and sports received primary emphasis. Music especially showed a rise, for music is the best contrast to the many network dramatic programs. Commentators on cooking, home economics, etc. also continued to fare well.

Educational Programs.—Time given over to universities, colleges, non-profit organizations, etc. was much more deftly employed in 1939 than ever before. Not only are non-profit organizations learning the mechanics of the new medium after a period of trial-and-error production, but they are being assisted professionally by educational directors now on the payrolls of stations and networks. On-the-scenes broadcasts of foreign news and events

similarly showed much improvement in 1939. (For a more thorough discussion of this type of programming see BROADCASTING.)

Literary-Musical Property.—Literary Property.—During the course of 1939, the radio stations of the U.S. were on the air an aggregate of 3,500,000 hours. This vast stretch of time naturally occasioned the use of much literary property (plays, stories, etc.) to provide listeners with a proper dramatic diet. Until the 1938–39 radio season (roughly from Sept. 1938 to May 1939) radio acquired its literary property chiefly by adaptation. That is, the works of such well-known literary giants as Shakespeare, O. Henry, Ibsen, etc. were shortened and remoulded for purely aural reception.

During the 1938–39 season, however, a most significant change took place. Prompted by the increase in dramatic programs and the competitive necessity of avoiding repetition, network program producers began to decrease the number of adaptations and increase the number of specially written radio works. This may be seen from the following statistics: during the 1938–39 season 165 plays and 60 books, poems, and short stories were adapted for network use; but during this same interval no less than 207 specially written dramatic features were broadcast. Ranging from tragedy to fables in verse, this new form of dramatic writing not infrequently displayed genuine merit, and focused increasing public attention on such authors as Arch Oboler, Norman Corwin, Merritt P. Allen, Milton Geiger and True Boardman, to cite but a few. It seems safe to say that as radio “finds” itself as a medium for dramatic literature, efforts in the direction of special dramatic writing for broadcast purposes will increase in quality and frequency. Fortunately, advances in such mechanical aids as sound-effects and acoustical devices, coupled with a rising scale of pay, are enhancing the opportunities for the new literary endeavours.

Musical Property.—No other form of radio entertainment even remotely approached in quantity the amount of popular music broadcast during 1939. In the course of 12 months, an estimated 1,000,000 hours, or nearly one-third of all time on the air, were devoted to this mammoth parade of “sweet,” “swing,” and “ballad.” Since the radio industry does not create this music, it has to license, or rent, the performing rights from various “societies” and individuals—that is, groups of composers, authors, and publishers who have united into business organizations to license the rights to their pooled musical compositions. Of these societies, the American Society of Composers, Authors and Publishers (ASCAP) engages in the heaviest traffic with the radio industry. For the use of ASCAP’s repertoire, stations annually pay ASCAP 5% of their receipts, a sum which in 1938 (last year for which figures are available) came to \$3,845,206.34.

Following the sporadic, but significant, demand for anti-ASCAP legislation on the part of individual broadcasters, the industry trade association (National Association of Broadcasters) in Sept. 1939 unanimously approved a plan for establishment of an industry-controlled music venture. Designed to outmanoeuvre ASCAP, as well as release the industry from the latter’s power, the new firm is called Broadcast Music, Inc. It is to be supported by an initial \$1,500,000 raised via the sale of stock and licences. Definitely placing the broadcast industry in the domain of music publishing and creation, Broadcast Music is, at this writing, in the process of formation. Whether the project will succeed, cannot as yet be foretold. But in any event, the broadcasters are determined, and the battle with ASCAP will be bitter. It will come to a head in Dec. 1940 when current ASCAP contracts are due for renewal. Should renewals satisfactory to both parties fail, a break with widespread repercussions will occur.

Phonograph Records.—Ordinary phonograph records have always been a convenient and economical means of programming

for many stations. In July 1939, this economy was threatened when a court decision held that the manufacturer of records can restrict their use to home phonographs only. Subsequently, record manufacturers have planned to prohibit use of their wares on radio stations unless a licence, scaled in the case of one manufacturer from \$1,200 to \$3,600 per annum, is first obtained. To date, new legal entanglements have held the situation in abeyance. However, should licences be issued in 1940, the cost to the industry will be quite appreciable, for about 11½% of all time on the air is occupied with the playing of phonograph records. For technical-experimental developments, television, facsimile, and frequency modulation, see RADIO, SCIENTIFIC DEVELOPMENTS OF; TELEVISION.

Short-Wave Programs.—Not a technical development, but certainly an economic experiment in 1939 was NBC’s selling of time for international short-wave programs to Latin and South America. United Fruit was the first sponsor, buying a news broadcast in Spanish. Prices for this type of broadcasting were set at \$25,000 for seven quarter-hours per week per year. However, sponsorship may be carried on only under the stringent rules devised by the FCC to regulate advertising.

Employment-Unionism.—Employment.—The radio industry can boast that it pays higher wages than any other U.S. industry. FCC statistics for 1939 credited the industry with the following:

Full Time Employees	18,359
Average Weekly Pay	\$45.20
Part Time Employees	4,377
Average Weekly Pay	\$23.55

As against the year before, payroll figures showed a rise in weekly compensation of \$0.08 for full time employees, and \$4.58 for part time employees. The sharp increase in part time compensation may be assumed to be due to unionization. However, the complete story is by no means told in the above-cited data. To these sums must be added the many millions of dollars expended for the services of such artists as Jack Benny, Burns and Allen, etc., who are employed, not by stations or networks, but by the sponsors whose wares they help advertise.

Unionization.—At no time in radio’s history has there been such a sudden and widespread mushrooming of unions as in 1939. The year’s foremost victory was won by the American Federation of Radio Artists, an arm of the American Federation of Labor. On February 12 this union was awarded a code of minimum terms and working conditions governing all actors, singers and announcers commercially performing on the major networks. The new code makes a “federation shop” mandatory—that is, a union shop continually open to new membership. Minimum pay scales for actors and announcers were set at \$15 per quarter-hour, while singers were awarded a minimum of \$40. Performers working on non-commercial (sustaining) network programs already had a contract prior to the commercial victory.

Meantime, it became evident in November that the industry would have to engage in another major union encounter in 1940 when contracts with the American Federation of Musicians are due for renewal.

Present contracts guarantee the A.F. of M. a minimum of \$3,000,000 annually from stations affiliated with major networks, plus special payments by the networks on their key stations in New York, Chicago and Hollywood. As the situation currently stands, the union wishes to increase station payments by 50% and network special payments by 100%.

Other 1939 union activity paled beside the above mentioned events, but a thorough—if local—job was being done by the technicians’ unions throughout the year in organizing engineers and technical operators. In fairness to both sides, however, it may be said that all activity and counter-activity caused no public

inconveniences whatsoever. Actual strikes and interruptions of broadcast schedules were so rare as to be negligible.

Radio v. Public.—Fully aware that standardized rules governing programming and business procedures are more acceptable to the public than haphazard regulation, the National Association of Broadcasters in July 1939, adopted a formal code of conduct. It specifies:

Children's programs . . . must not contain sequences involving horror or torture or use of the supernatural or superstitious or any other material which might reasonably be regarded as likely to overstimulate the child listener, or be prejudicial to sound character development. No advertising appeal which would encourage activities of a dangerous social nature will be permitted. . . .

Time for the presentation of controversial issues shall not be sold, except for political broadcasts. . . .

Broadcasters . . . will continue their search for improving applications of radio as an educational adjunct. . . .

News shall be presented in fairness and accuracy and the broadcasting station or network shall satisfy itself that arrangements made for obtaining news insure this result. . . .

Radio . . . may not be used to convey attacks upon another's race or religion. . . .

The code further specified limitations on the amount of time which may be devoted to advertising on radio programs, and listed certain types of products and advertising appeals which are henceforth unacceptable. While the code to date has not put any barriers in the way of the Father Coughlin broadcasts (mainly because of prior contractual obligations on the part of stations), it is generally viewed as a healthy and far-sighted development in the industry. Meantime, the National Broadcasting Co. issued a code of its own, clearly stating public obligations to be observed in network broadcasting, and the three major networks—NBC, CBS and Mutual—in September formulated a set of self-imposed rules governing fair and accurate news coverage of the European war. (See BROADCASTING.)

Research.—Industry research in 1939, as in the previous several years, again centred mainly around the problem of determining how large an audience is commanded by each of the various programs. The ramifications of this matter are too lengthy and technical to be discussed here. Suffice it to say that the following methods of determining program popularity were either actively employed or tested in 1939: (a) telephone surveys involving a review of the listener's radio activity over the past several hours; (b) coincidental telephone surveys—that is, asking the interviewee to what program he is *now* listening; (c) personal interviews; (d) measurement of listening by means of automatic recording devices attached to receiving sets.

Most important also was a survey completed by the Joint Committee on Radio Research on the subject of rural radio. Its highlights were: 69% of all rural families (or 9,470,900) owned at least one radio set as of Jan. 1, 1938; 5.8% rural homes have multiple sets; the median daily use of rural radio sets is four hours, 47 minutes.

As to the 1939 total number of sets in the U.S., the publication *Radio Today* estimated 45,200,000 (including auto, portable and multiple sets) owned by 28,700,000 families.

Government v. Industry.—Broadcasting in all its phases is regulated by the Federal Communications Commission, a seven-man board appointed to administer the Radio Act of 1934. Any discussion of this administration is best approached from a legal angle, and will not be attempted here. But some reference to the general situation may be profitable.

Changes in FCC Personnel.—Two new members were added to the FCC in 1939: James Lawrence Fly, previously general counsel of the Tennessee Valley Authority, who became FCC chairman in September, succeeding Frank R. McNinch, resigned; and Frederick Ingate Thompson, newspaper publisher, who took the place of Eugene O. Sykes, also resigned. Mr. Fly's appointment as chairman was generally hailed in the broadcasting industry as

presaging improved relations between members of the FCC, and between the FCC and the industry as a whole.

FCC Rules and Regulations.—As the result of extensive hearings dating back to 1937, the FCC issued in 1939 a new set of regulations governing standard broadcast stations. The most noteworthy of these regulations were: (1) refusal to allot wattage as high as 500,000 because of "speculative risks, unsupported by adequate data, even though it be true from a technical standpoint that 500kw. power is one of the methods to improve service in rural areas"; (2) station power increases where needed and feasible; and (3) the safeguarding of rural and small-town coverage through preservation of 26 clear channels free of any nighttime duplication, and 18 additional channels in such shape as to be relatively free from interference in outlying areas.

While the commission throughout the year found itself in the dilemma of whether to adopt socio-economic viewpoints in the regulation of the industry, or whether to confine itself to technical factors alone, there was some relaxation in the tendency to wander too far afield in socio-economic directions. Fewer inquiries into the minutest financial and programming affairs of stations were promised for the future.

Agitation for changes in the commission came to naught on the part of Congress. Less and less fear was expressed over newspaper ownership of stations (publishers own one-third of all U.S. stations either wholly or in part). And censorship—that is, stringent regulation of programs—dwindled after the incipient tendency was loudly decried. Meantime the FCC carried on exhaustive hearings as to the operation and management of the major networks. The results of this investigation have, to date, not been made known.

As a subsidiary development in radio's relations with the Government, it might also be noted that in 1939 representatives from radio were for the first time admitted to Congress and the White House on the same footing as representatives from the press.

Radio in the Western Hemisphere.—The radio stations of North, Central and South America have one common characteristic which distinguishes them from the radio stations of the Old World: they are principally operated on the economic foundation of advertising. Estimates for 1939 indicate that there are 510 stations in the 20 Central and South American nations,¹ and an aggregate set ownership of roughly 2,500,000. Canada meantime has 85 stations, and a total set ownership of 2,000,500.

These figures, when compared to statistics for the United States, show that the latter has over one-sixth again as many stations as the rest of the western hemisphere combined, and ten times as many radio sets, although the population of the U.S. is no greater than that of all the neighbour nations. This mighty preponderance of the U.S. in broadcast facilities and set ownership may be ascribed, at least in part, to the coverage problems of the other nations. Faced with large, and sometimes oddly-shaped, land areas, these nations had to contend with the dilemma of serving scattered population without incurring financial disaster. Furthermore, national boundaries, the barriers of language and the widely-spaced concentrations of humans and human wealth have created bizarre marketing conditions to begin with, and these reflect on the amount and feasibility of radio advertising.

It is not unique, therefore, that the broadcast operations of the U.S.'s neighbours are on a smaller scale than those of the U.S. Except for Canada, networks play no integral role in the radio picture, being hindered by geographical-political confines and the economic hardships of long "line hauls." Programming likewise is far less elaborate. Music, news, a certain amount of drama, and perhaps some scattered tests-contests, form the principal en-

¹Excluding some short-wave stations used for national purposes.

tertainment values. But while the factors of geography and history indicate that the U.S.'s radio leadership will not be challenged for many years to come, it is safe to say that radio's importance in the national life of the western hemisphere will grow rapidly and soundly.

Canadian Radio.—Under 1939 plans, the CBC will control all high-power wattage in Canada. Private broadcasters are envisioned in the role of providing "local coverage," and increases in private wattage, if any, will be sparing. A tendency toward network rate-regulation of private stations is afoot. Private stations, once allowed to form their own networks, no longer may do so without the approval of the Canadian Broadcasting Co.

Canadian Radio vs. the War.—Due to European hostilities, the CBC made certain regulations governing the broadcast industry's conduct during the war. These regulations specified: (1) obedience to a censorship board which, however, intended to interfere as little as possible with the "ordinary avocations of life and the enjoyment of property;" (2) guarding of CBC property by the R.C.M.P. to prevent sabotage; (3) submission of advance information on talks and speakers; (4) prohibition of all foreign language broadcasts; (5) discontinuance of weather reports east of Toronto; (6) discontinuance of broadcasting from public meetings; (7) submission of news copy to the censorship board. CBC employees, except in specific instances, were exempt from military service.

North American Regional Broadcast Agreement.—In 1937 the four principal nations of North America—the United States, Canada, Cuba and Mexico—negotiated an agreement to facilitate better apportionment of wave-lengths, power and interference-free reception. Cuba, Canada and the United States ratified the agreement not long afterward, but Mexico during most of 1939 continued to be a stumbling block, again delaying the signing of the negotiation. It was rumoured that the difficulties resulting from Mexico's failure to ratify were brought about at the insistence of certain high-powered border stations (some of which are financed by U.S. capital and located in Mexico to evade U.S. regulations). In early December the situation, already bad, grew worse when a second rumour spread that the Mexican border stations would actually "jump" on frequencies already held by important U.S. stations. However, on almost the very last day of the year—on December 29—the Mexican Senate suddenly committed an amazing about-face and ratified the agreement, effective in 90 days. At present it is too early to see whether, and to what extent, the ratification is complicated with reservations or qualifications. But the prospects do seem bright for better wave-length order between the "neighbour nations" in the future, and Mexico's sudden ratification undoubtedly was brought about by a realization on the part of the majority of Mexican broadcasters that disorder works many an economic hardship. (E. A. Gd.)

Radio, Scientific Developments of. Radio has become so wide-flung an activity, both geographically and in its technical scope, that a brief annual review of scientific progress must necessarily be limited to features of outstanding importance and interest. The radio services of relatively long standing, such as those which carry speech or telegraphic messages across the continents and oceans and those which broadcast music and information to the publics of many lands, have continued to prove their worth but have adopted few modifications in technique. The major scientific developments have, perhaps naturally, been a part of the newer services such as ultra-high-frequency broadcasting, television and facsimile transmission. However, more recent applications of methods of observation and measurement, including particularly the use of that powerful research tool provided by the

A PORTABLE RADIO TRANSMITTER weighing less than 100lb. was built in 1939 for transoceanic broadcasts

cathode ray tube as an oscillograph, have added to the store of knowledge as to fundamentals and as to performance in all branches, old and new, of the radio field.

Before passing to a consideration of the scientific developments in the still less extensively applied portions of radio, it should be noted that in ordinary broadcasting there has been achieved considerable progress in improving the realism or naturalness of tone reproduction. For some years it has been recognized that speech and music, as provided in the home by a broadcast receiver, did not sound fully natural. That it did not represent a true replica of the sounds originating in the studios was attributed largely to the fact that the system as a whole (microphone, transmitter, receiver and loudspeaker) was not designed to carry effectively the entire range of audible sound frequencies from, say, 16 to 16,000 vibrations per second. To improve the situation, individual transmitters and receivers had been made to extend the usual range of perhaps 80–5,000 vibrations to as high as 10,000, but strangely enough (as it seemed) the wider range systems were less acceptable than the older ones, because the tones showed an unpleasant sibilant roughness. In the year 1939 this apparently anomalous result came to be generally understood, and the fault recognized to lie not in the extension of the tone-frequency range but in the failure of the earlier experimenters to detect and minimize non-linearity or harmonic distortion in their apparatus. Consequently some of the newer tools for reducing such distortion, such as the so-called inverse feed-back systems, are coming into wider use, and the tone-frequency range of broadcasting is being usefully extended and the fidelity of reproduction thus improved.

Radio facsimile, in which a picture or text passed through the transmitter is automatically copied or reproduced on paper at one or many distant radio-operated recorders, has benefited from substantial scientific improvements during 1939. The most successful facsimile recorders utilize either a carbon paper for mechanical impression of the symbols or a specially treated paper which changes colour when acted upon thermally or electrolytically. Improvements in the recording papers and in the recorders themselves have made possible the transmission of type or drawings at speeds in excess of 16 sq.in. per minute, with sufficiently exact reproduction to show 8-point type clearly and legibly. Under such conditions, text may be transmitted by radio at speeds in excess

of 300 words per minute, something like five times the word-speed of the page-printing telegraph.

One of the problems of facsimile transmission between widely separated points has been, in common with photo-radio, the automatic synchronization or locking together of the transmitting device and the reproducing recorder. The year 1939 has seen the completion of substantial improvements whereby it is no longer necessary to utilize such cumbersome and expensive systems as those having electrically-controlled tuning forks to permit synchronous operation.

In ultra-high-frequency radio transmission, both for broadcasting and for point-to-point service, progress has been made in the provision of vacuum tubes for higher powers at the upper frequencies. Likewise, ultra-high-frequency receivers have been greatly improved as to sensitiveness, simplicity of operation and stability. The most striking event of 1939, however, was the rapid development of the system of frequency modulation, as contrasted against the slow growth of the older system of amplitude modulation, both in the ultra-high-frequency portions of the radio spectrum. In frequency-modulation, the transmitter radiates constantly at its full power level but the frequency of the carrier waves is swung above and below the nominal value, in accordance with the signals to be transmitted. This new method of operation has been adopted by a number of broadcasting and relay stations, notably the experimental plant of Professor E. H. Armstrong, of Columbia University, and shows promise of wide further application. The importance and practical value of the system are due primarily to its inherent noise-reducing characteristics, by means of which it discriminates against not only radio interference from lightning, but the electrical disturbances due to automobile ignition, diathermy, and so forth, which have heretofore been the *bête noire* of ultra-high-frequency radio transmission of sound, facsimile and television. During the year 1939, transmission by wide-band frequency-modulation, on waves of approximately 43 megacycles per second, has been so completely and repeatedly tested under service conditions, and with such success, that its future wide-spread application to broadcasting and other radio services would seem to be assured. (See also ADVERTISING; AIRPORTS; BROADCASTING; RADIO, INDUSTRIAL ASPECTS OF; TELEVISION.)

(J. V. L. H.)

Radio Facsimile: see RADIO, SCIENTIFIC DEVELOPMENTS OF.

Radiology. During 1939 the intimate study of radiation effects on the living normal and tumour cell was intensified. Increase in the voltage and intensity of X-rays, while offering profound tissue effects has not materially improved the statistics of cancer mortality. Ambitious attempts with artificial radioactivity by means of the cyclotron have shown profound effects on experimental animals but these effects are not as yet transposed or transferred into human equations of value.

Radiation Therapy for Infections.—Satisfactory radiation in many inflammatory diseases of the skin and of organs, such as boils, carbuncles, erysipelas, parotitis, mastoiditis and other glandular infections, has provided an elaborate literature lately. Gas bacillus infections are included.

Cine-roentgenography.—The manufacture of extremely rapid photographic film and the construction of fluoroscopic screens of increased fluorescence have led to two important advances in radiology. Cine-roentgenography by the indirect method consists in photographing the fluoroscopic image by means of a motion picture camera equipped with a special lens (F/0.85, focal length 5.5 cm.).

The ability to study the circulating blood stream by cine-roentgenography has produced discoveries in the physiology of the

NO AERIAL OR GROUND WIRES are required in this radio set, developed in 1939

foetal blood circulation. The transitional stage between the foetal and adult types of circulation has been studied by Barclay in new-born lambs. Barclay is the first to study the foetal circulation and, what is more important, the transition from foetal to adult circulation in the new born.

Photo-roentgenography.—The indirect method of photo-roentgenography has been developed to practical usefulness in the roentgen examination of tuberculous patients in clinics and sanatoria where the use of large films for each patient becomes an item of great expense.

This method will compete with non-transparent paper film both in expense and diagnostic values.

Ordinary or cinematographic cameras are incorporated in the apparatus. If very small films are used they may be enlarged or projected to a larger size for interpretation. If a 4x5 photographic film is used in the camera that photographs the fluoroscopic image produced by the X-ray exposure, then the film costs will be cut one-eleventh. Not only the film costs but the filing costs are greatly decreased.

The advantages of X-ray examinations of the chest in tuberculosis clinics and in the survey of industrial workmen in hazardous dust occupations are now quite well established. This method has been recommended for the roentgen examination of large groups of school children, soldiers, sailors, hospital personnel. It is advisable that the usual large film examination be completed for the more accurate diagnosis of those cases which this rapid and cheap survey method culls from the larger groups.

Body-section Roentgenography.—This generic term has been applied to the various methods which seek to radiograph a selected layer of the body to the exclusion of all other layers. Priority claims are quite chaotic although an article by Keiffer furnishes a complete record and mathematical analysis of the principles involved. Specific terms such as stratigraphy, tomography, planigraphy, vertigraphy and laminagraphy are identified by the me-

chanical devices which seek to apply the principle of body-section radiography, to wit: "If a source of visible light and a recording medium be revolved about a fixed axis, the shadow of any object in this axis will maintain a constant relationship to the light and the recording medium." The practical application of this principle was extended considerably during 1939, and it offered considerable advantage over ordinary exposures, especially about the head, neck and chest.

Retroperitoneal lymph nodes—Lymphoblastoma.—Desjardins focuses attention upon the importance of the retroperitoneal lymph nodes in cases of malignant tumours. In cases of lymphoblastoma (Hodgkin's disease and lymphosarcoma) he indicates the diagnostic value of roentgen therapy; the prognostic value of the rate of regression; and cautions concerning the untoward effect of excessive quantitative doses of roentgen therapy. He especially erects a symptomatology of abdominal lymph gland involvement in carcinoma as a primary or metastatic display and the possibility of confusion in the diagnosis of secondary retroperitoneal gland enlargements after the removal of ovarian or testicular new growths. (See also X-RAY.)

Radiotherapy: see RADIOLOGY.

Radium. When the world's supply of radium was obtained from the comparatively lean ores of Czecho-Slovakia, the United States, Australia and Portugal, the price of the product was \$100,000 or more per gram; the discovery of much richer ores in the Belgian Congo brought the price down to \$70,000, and with the collapse of world buying power in 1929 it was reduced to \$50,000; new deposits of unparalleled richness have been discovered in Canada, and since the construction of a refinery for their treatment the official quotation has been cut to \$40,000, but it is reported that purchases could be made at \$25,000, or even as low as \$20,000 in quantity.

Production of refined radium salts began in Canada in 1933, with 3.0 grams of radium content, but later additions to the refinery have greatly expanded the operations. In 1937, the milling of 23,838 short tons of ore yielded 475 tons of pitchblende concentrates, from 290 tons of which 23,868 grams of radium were recovered.

Press reports give the 1938 output at 70 grams and the rate of operation at 9 grams monthly. The entire output is shipped to England for measuring and packing into treatment needles, after which much of it is returned to Canada for sale. It has been reported that Congo and Canadian producers have agreed on a division of the market on a 60:40 basis. Although the radium-bearing ores of Colorado and Utah have been mined on an increasing scale during the past two or three years, this is primarily for their vanadium content, and little radium is recovered.

The United States is the largest consumer of radium, and imports have increased heavily; during the decade 1928-1937 imports of radium salts totalled 138.32 grams; during 1938 the imports rose to 38.75 grams, and in nine months of 1939 to 70.5 grams, an amount in excess of the entire world output only a few years earlier.

(See also STANDARDS, NATIONAL BUREAU OF; STERILIZATION; VANADIUM.) (G. A. Ro.)

Railroad Accidents: see DISASTERS.

Railroads. The railroads of the United States, considered collectively, fared much better in 1939 than in the critical year 1938. In 1939 they earned their fixed charges and had a surplus of about \$95,000,000. In the preceding year they failed by \$123,000,000 to earn their fixed charges. They were, therefore, \$218,000,000 better off in 1939 but the surplus of \$95,000,000 after fixed charges is a painfully small amount to meet the needs of additions and betterments that should be financed from income and to satisfy the dividend-hungry holders of approximately \$8,000,000,000 par value of railroad stocks. Stated in other terms the 1939 net railway operating income, the part of operating revenues left after the payment of expenses and taxes, was equivalent to a return of 2.26% on the book value of road and equipment, the working cash balance, and the investment in materials and supplies. The rate of return in 1938 was 1.43%. The Interstate Commerce Commission in 1922 defined a fair return as 5.75%. The Commission has found that the physical value of railroad properties is slightly in excess of the net capitalization and that from that viewpoint the railroads collectively are not overcapitalized, yet the 1939 return of but 2.26% on that value, if continued, would mean insolvency on a greater scale than now exists.

The situation with respect to insolvency changed but slightly during the year. At the beginning of 1939 the mileage of all railroads in equity receivership, or in reorganization under Section 77 of the Bankruptcy Act, was 76,938. At the end of the year it was 77,414, an increase of 476 miles. The percentage of mileage in bankruptcy proceedings at the end of the year was 31% of the total railroad mileage of all classes. For Class I railroads alone (those with operating revenues of \$1,000,000 or more) the percentage was 32.1%. In that class are 39 bankrupt railroads. Their investment value is 27.7% of the total of Class I; their capital stock, 26.4%; their funded debt, 32.4%; their operating revenues, 23.9%; and the number of their employees, 25.9%. The disparity between the percentages of capital stock and of funded debt is of significance inasmuch as it indicates that the bankrupt roads collectively are those whose bonds form too large a part of the total capitalization.

While no Class I railroad emerged from bankruptcy proceedings during 1939, some progress in reorganization has been made. Plans for three Class I properties were promulgated by the Interstate Commerce Commission and approved by the courts but have not been finally confirmed by all interests. Other plans are going through the procedural steps. Of the plans for 21 properties, either approved by the Commission or proposed by its examiners, the capital structure of the new companies would reflect reductions of about 60% in funded debt and about 75% in annual fixed charges.

While the depressed state of business in general explains in

CLASS I RAILROADS, United States: Revenue passengers carried one mile

CLASS I RAILROADS, United States: tons of freight carried one mile

greater part the recent serious impairment in railroad earning power, the effective growth of competing forms of transportation accounts for a substantial part of the railroad loss. Supported in the main by governmental subsidy the inland waterways are taking a large amount of the low grade commodities which do not require expedited service. Subsidized in part, the trucks are cutting heavily into high grade and some low grade commodities and the buses are attracting the thrifty passengers who formerly travelled by rail. The pipe lines are constantly being extended and are moving petroleum and its products in large quantities. The passenger traffic by aeroplane has shown a spectacular growth during 1939 and the railroads are losing heavily in passengers who formerly patronized the excess fare trains. And finally the amount of private transportation—passengers in their own automobiles, manufacturers and merchants operating their own trucks, and barges, and oil producers, refiners and distributors using their own pipe lines, trucks and barges—continues to increase and to divert traffic from the common carriers in all forms of commercial transportation. (See also AVIATION, CIVIL; MOTOR TRANSPORTATION.)

The railroads have been fighting hard to bring about what they call "equality of opportunity" in competition. They complain about subsidy to the operators on the inland waterways, on the highways, and in the air, and they ask for regulation of all of their competitors in a degree that corresponds to the regulation of railroads. Comprehensive legislation that would remove a substantial part of the competitive inequality came near to enactment in 1939. Bills, with approximately the same objectives, were passed by the Senate and the House, but the differences in detail could not be reconciled in the conferences of the joint committee before Congress adjourned. These bills were on the calendar of the 1940 Congress, the conference committee was at work, and there was ground for the hope that something will be done by Congress in 1940. The question on which there is controversy in greatest degree is that of subjecting water carriers to more intensive public regulation.

To improve their competitive position in other important respects the railroads made strides in 1939 in improving the quality of their service. The number of modern streamline passenger trains, moving at high speed, has been increased from 62 to 82 and many innovations have been introduced to make travel by rail more comfortable and attractive, in coaches as well as in sleepers and parlor cars. Freight service has been expedited and many bold experiments are being tried both in rates and in service. Operating efficiency is on a higher plane and several new records have been established, such as in ton-miles per train-hour and ton-miles per freight car day.

When the certainty of war on an extensive scale was seen in the invasion of Poland, there was doubt whether American railroads would be capable of taking care of their part of increased industrial activities. The beginning of the war undoubtedly had an

important influence in the sharp increase in American railroad traffic in October and November. Notwithstanding the curtailment in expenditures for maintenance and a marked slowing up in the normal program for additions and betterments during the depression, the railroads were able to handle the heavier volume of traffic satisfactorily and the urge to provide more locomotives and cars and the improved earnings which made available more funds for the purpose, resulted in a comprehensive program to recondition the idle locomotives and freight cars, and to acquire new equipment by purchase from the locomotive and car builders. At the close of 1939, therefore, there was basis for the prediction that the railroads will not be found wanting in 1940.

In contrast with many of the other large industries the railroads went through the year 1939 without a strike or other labour controversy. It should be noted, however, that the freedom from conflict must be a source of greater satisfaction to labour than to management inasmuch as the decisions of the governmental agencies have, in the main, been to the advantage of labour.

The operating results of Class I railroads (as shown in the Jan. 6, 1940, annual statistical issue of the *Railway Age*) in 1929, the year of greatest operating revenues; in 1934, a year midway in the depression; and 1939, afford comparisons of three periods five years apart. The results in 1939 are strikingly unfavourable in comparison with those of 1929, but the opposite is true of the comparison of 1939 with 1934.

Operating Results, Class I Railroads, 1929, 1934, 1939 (U.S.)
(In Millions)

(W. J. C.)

Europe.—The catadysm of a European war has, of necessity, delayed progress after the end of August 1939, and a general note outlining the methods by which European railways of both belligerent and neutral countries adjusted themselves to the changed conditions will be found hereunder. The following sections applying to individual countries relate, therefore, only to the peace-time period Jan.-Aug. 1939, so far as the European railway systems are concerned.

Great Britain.—There were very few changes in passenger train services as a result of the inauguration of the summer services, and, while the total daily mileage at start to stop speeds of a mile a minute reached the 12,000mi. figure for the first time, there was a slight decrease in mileage daily covered at 64 m.p.h. and over. The London and North Eastern railway streamliners and the "Cheltenham Flyer" alone exceeded the 70 m.p.h. throughout average.

In other respects, however, the year 1939 has not been devoid of railway progress: for instance, the Southern railway completed its 1935 electrification project, embracing 612 track miles, by changing over from steam to electric traction on its lines from Swanley and Gravesend to Maidstone, Rochester and Gillingham on June 30. The standard Southern railway system of 660 volts d.c., using third rail feed, was utilized and two-car sets of unusual

width were constructed for the service, operating as 4, 6 or 8-car trains. Progress was also made with the suburban and main-line electrification schemes of the London and North Eastern railway, the former covering the London (Liverpool Street)—Shenfield and allied services and the latter concerning the main-line over the Pennine Range between Sheffield and Manchester. The former is to be operated by multiple unit trains and the latter by electric locomotives. Both were due for completion in 1940 but may be held up indefinitely as a result of the outbreak of war. As a result of the rising price of coal the Great Western railway early in 1938 undertook a study of the financial prospects likely to be achieved from a conversion from steam to electric traction of its main-line from Taunton to Penzance with the respective branches. The resulting survey was made public in 1939, and conclusively proved that under British conditions main-line electrification is only a successful financial proposition where special characteristics exist, as for instance the Woodhead tunnel on the Manchester-Sheffield section, London and North Eastern railway. The completion of certain very important resignalling schemes can be recorded, notably that at Victoria, Southern railway, where three signal cabins were replaced in June by one all-electric 225 lever-frame cabin in conjunction with the use of colour light signals. Another installation, completed in May, was that at Darlington, London and North Eastern railway, with a 155 lever-frame, the point operation being all-electric.

The reconstruction of the largest London Midland and Scottish railway classification yard at Toton was completed in May, and since then Frölich type rail brakes, as in use at Whitmoor and Hull, London and North Eastern railway, have been controlling the braking of wagons on the down side. Toton deals mainly with coal traffic and can deal with 7,500 wagons per working day. A feature of British railway policy of recent years, and one different from that of other European countries has been the construction of large numbers of passenger cars for local, suburban and country branch line services as well as for main-line services. This policy has been continued with excellent results and has done much to retain passenger traffic on secondary lines. The same policy has been adopted in regard to locomotives and, while large numbers of standard type main-line locomotives continued to be turned out, new locomotive power for branch lines has not been neglected. The reliability of modern steam locomotive designs is well illustrated by the fact that one 3-cylinder streamlined London and North Eastern railway "Pacific" worked the "Coronation" express for 39 consecutive trips, one of the fastest trains in the world; the punctuality of this train is remarkable, for in April and May its very fast schedule to Newcastle was adhered to on all but two occasions. Progress continues to be made with the program of linking up the London underground system with the main-lines, and the extension of the tube trains to Stanmore in November marked another stage in this huge program, commenced in 1935 and estimated to cost nearly £45,000,000.

Eire.—In Eire the placing in service of new 3-cylinder 4-6-0 type express locomotives has permitted a material reduction in the scheduled running time between Dublin and Cork, even with somewhat increased loads.

France.—There has been no outstanding feature of progress to record on the French National railways other than the official opening of the last electrified section of the Paris-Orleans railway between Tours and Bordeaux in the early spring of 1939. This link gives the French National an electrified main-line throughout from Paris to Bordeaux and the Spanish frontier at Hendaye. The Sud Express was timed to cover this 362½ mi. to Bordeaux at an average of 64.1 m.p.h. On other main-lines deceleration and suppression of trains was the order of the day, notably the elimination of the fast rail cars to Havre, and the streamlined steam express between

Paris and Lyons. The financial position of the French railway system has been a drain on the national finances for many years and these reductions in service were made for the sake of economy.

Germany.—The summer timetables in Germany, on the other hand, included a number of new Diesel flyers, 16 services of this type in all being operated; in the case of the "Flying Köln" the bookings between Berlin and Hanover and then to Hamm were at 83.2 and 83.1 m.p.h. respectively, the fastest regular rail timings in the world prior to the outbreak of war. Germany's claim to a world speed record on rails is substantiated by the test run of the articulated "Flying Fish" 3-car Diesel unit, which attained 133.6 m.p.h. on the Berlin-Hamburg line on June 26. The German rolling stock construction program for 1939 included orders for over 1,000 locomotives, a large increase over the output for the immediately preceding years.

Italy.—With the inauguration of the summer train services in 1939 the Italian State railways virtually revolutionized their passenger schedules, with runs averaging 65.5 m.p.h. over the 392.8 miles between Milan and Rome, and similar speeds on to Naples including intermediate stops; in fact Italy could claim daily a mileage of 1,187 at over 70 m.p.h. and 7,247 mi. at over 60 miles per hour. Most of these services are operated with light electric multiple unit sets, but there are also many fast light Diesel units. Electrification is being extended rapidly and in October the Italian section of the Gotthard route was converted to electric traction.

Other European Countries.—Holland celebrated its railway centenary in 1939 and few countries could claim to have so revolutionized their passenger services during any 12 months. During 1938-39 further high speed Diesel trains have been inaugurated running to Groningen, Oldenzaal and Maastricht on even internal services, while multiple unit electric sets cover the routes carrying denser traffic, namely Eindhoven, Arnhem, Amsterdam and Rotterdam. In Denmark further improvements were made in the Diesel "Lightning" train services, thanks to the inauguration of a new train ferry across the Great Belt, and the State railways could claim 26 daily runs at over 58 m.p.h., a remarkable achievement for a small country. Two other large bridges are under construction, one at Ulvsund and another at Limfjord. Norway is one of the few European countries still engaged in railway construction and, like Sweden, is turning steadily to electric traction. Switzerland built one of the most powerful electric locomotives in the world, rated at 12,000 h.p., and improved the speed of its inter-city services. The Belgian National railways placed in service some very fast light steam trains between Brussels and Ostend, the 57.7 miles from Brussels to Bruges being run in 46 minutes, 75.3 m.p.h.; streamlined "Atlantic" type locomotives were built for this service. Additional mileage was electrified on the Antwerp-Brussels route.

European Railways and the War.—As a result of the European war the Polish State railway system has disappeared, some of its lines being absorbed in the Oppeln and Koenigsberg divisions and others forming the new Posen division of the German railway; Eastern Polish lines were taken over by the Soviet authorities. In all the countries concerned Diesel traction for a time virtually disappeared owing to the scarcity of oil, and many passenger trains hauled by steam and electric power had to be cancelled in order that the additional freight traffic due to the war could be handled expeditiously. The operating difficulties caused by the "black-out" for fear of air raids proved serious and the passenger trains could only be illuminated internally by blue lamps. The war caused a complete revolution in traffic routing, while the dangers at sea diverted to the railways large volumes of traffic normally water borne.

Asia.—Construction is due for completion in 1940 of the railway connecting Turkey with Baghdad via Mosul, bringing Iraq into rail communication with Europe whenever a train-ferry service is inaugurated across the Bosphorus. From Erzingan the line to Erzerum was opened by November, 1939, linking the Turkish and U.S.S.R. railways. One of a series of bad accidents on the Indian railways caused the appointment of a special committee, headed by Lt. Col. Mount of the British Ministry of Transport, assisted by British and French engineering experts. The Mount committee's report in July, resulting from the Bihta accident on the East India railway, is one of the most important contributions to the study of locomotive movements at speed produced during recent years. In the Far East there has been considerable activity in the opening of new lines in Manchoukuo and Russian Siberia.

Africa.—After a long series of prosperous years, during which the South African railways administration had difficulty in handling the traffic offering, 1939 witnessed some retrogression, but the conservative financial policy adopted, together with enormous increases made recently in regard to rolling stock, have served to build up a well-equipped railway system with a large proportion of its mileage, both main-line and suburban, electrified in accordance with the most modern practice. Both on the 3 ft. 6 in. South African lines and on the Kenya and Uganda railways the Garratt type locomotive has proved useful, permitting enhanced tractive power in relation to the limited axle load allowed. Some new Garratts for the Kenya and Uganda railways of 4-8-4+4-8-4 type are believed to be the heaviest locomotives operating on 50 lb. per yard rails, since they weigh 186 tons and lift trains from sea level over two summits, one 7,857 ft. just beyond Nairobi, another of 9,130 ft. 52½ mi. from Mombasa. These new engines run from Nairobi to Kampala and back in 24 hours, a distance of 1,100 miles.

Australia and New Zealand.—The famous "Spirit of Progress" express of the Victorian Government railways, with all-metal rolling stock of a design unique in Australia, has earned considerable fame with its non-stop run on week days between Melbourne and Albury, 190¾ miles. The New South Wales railways have also speeded up their services; specific mention should be made of that system's Diesel unit, the "Silver City Comet," running on the Broken Hill-Sidney line. The transcontinental service to and from Western Australia has been improved, and, in another sphere, Victorian railways have made railway history by their pioneering achievement in regard to welding of rails into long lengths. The New Zealand Government railways continue construction of new rail links connecting various detached sections; one such line is in the North Island between

Palmerston North and Napier, but work will not be completed for some years. Large numbers of new 4-8-4 type locomotives, weighing 140 tons are being placed in service, permitting much heavier loads to be handled.

South America.—The development of Diesel trains and railcars continues on the various Argentine railways and in neighbouring countries, but the acceleration of steam services has not been neglected; there has been considerable speeding up on the Central Argentine main-line. Railway construction has not ceased in South America, over 600mi. being under construction, Brazil accounting for over one-third. In the same country further mileage is being electrified.

Canada.—After a long period of declining traffics the two great Canadian railways experienced a rapid revival of prosperity during 1939, thanks to absence of droughts and increased industrial activity resulting from the European war. There has been little reference in 1939 to alleged redundancy of mileage and rolling stock which was the object of criticism in earlier years: in fact both Canadian lines have placed large orders for equipment to deal with traffic offering. Their Majesties' visit called for masterful organizing ability by the Canadian National and Canadian Pacific, the specially prepared train covering 8,377mi., some of it in the Eastern States; there was no operating hitch, one locomotive hauling the train throughout from Quebec to Vancouver. Rayon. The newest of the fibres continued to hold the centre of textile interest in 1939 as its total production increased 13.6% in filament yarn and 7.1% in staple fibre. Consumption in the United States, the chief producing and consuming country, reached a new high. The 1939 United States consumption figure was estimated at 356,000,000lb. of rayon yarn and 100,000,000lb. of rayon staple. This represents an increase of 82,000,000lb. over 1938 consumption of rayon yarn and an increase of 47,000,000lb. of rayon staple. Both figures are the largest ever known and are indicative of the rising tide of rayon.

The greatest percentage of gain was made in staple fibre which produces fabrics with the softness of wool and the dull lustre of silk. The men's wear fabrics of staple rayon made heavy inroads into the wool territory. In the United States, production increased 76.7% in 1939, and in Great Britain the increase was 93.5%. A new field of use for the staple fibre was the carpet and rug industry. Previously, the tendency of rayon to stay permanently crushed made it impractical for rugs or floor coverings. But constant improvements through experimentation and research have developed a fibre that resists footsteps. Rayon having invaded the cotton and silk markets, its conquest of wool seems well under way. In linen competition, shortage of flax supplies because of war conditions in the chief sources of supply, Russia, Poland, and adjacent countries, gives rayon an opportunity to make further progress during 1940.

In table damask, rayon is already popular, as it enhances the design and is washable.

Rayon made notable progress in 1939 in the hosiery field. For the past five years, hosiery has been considered the last remaining stronghold of silk because rayon did not have the required elasticity for full-fashioned knitting. As long as silk stayed at relatively low prices, there was little inducement on the part of the hosiery manufacturer to experiment with rayon yarns. In the meantime, however, rayon yarn manufacturers were continuing to improve their product with the hosiery goal in view and 1939 gave them the opportunity to show what had been accomplished. The price of silk increased so rapidly and unreasonably in the latter part of the year that hosiery manufacturers sought relief. The first interest was in nylon. The publicity attendant upon nylon, as shown at the DuPont industries exhibit at the New York World's Fair made nylon hosiery a necessity for any retailer during 1940. The many superior features of nylon hosiery, the

Rayon Production

	Filament Yarn (1000s of lb.)		Staple Fibre (1000s of lb.)	
	1939	Compared to 1938	1939	Compared to 1938
United States . .	331,000	+28.8%	53,000	+76.7%
Japan	230,000	+10.0%	275,000	+26.7%
Germany	160,000	+13.5%	450,000	+36.4%
Italy	120,000	+18.8%	180,000	+8.4%
France	65,000	+6.6%	not available	..
Total	1,125,000	+13.6%	1,025,000	+7.1%

result of actual wear tests over a period of a year, aroused interest throughout the world and in Nov. 1939, the hosiery was placed on sale, as an experiment, in six Wilmington, Del. stores at prices generally above the average price of silk hosiery. During the first three days of the sale, it was reported in the *Underwear and Hosiery Review*, practically no other full-fashioned hosiery was sold.

Other local stores not having nylon suffered losses in their hosiery volume.

An improved rayon cuprammonium yarn for hosiery was also ready for hosiery.

Another new fibre in the synthetic field was *vinylon*, a plastic material like nylon, but manufactured under a different process by the Viscose Company. It is produced from a resin of the vinyl group. This yarn is being featured for industrial use, sewing threads, pressed felts. Because of its resistance to alkalis and mineral acids, as well as moisture, mould and mildew, vinylon yarn is expected to play an important part in industrial cloths of many descriptions. Its resistance to ignition makes it desirable for the furniture and interior decoration field. The year 1939 saw its presentation principally in upholstery fabrics, duck and filter cloths.

Glass fibre received almost equal publicity in 1939. Fibre glass shower curtains and window draperies were shown at the New York World's Fair and retail stores in the larger cities reported a demand for them from consumers. Because of their relatively high cost at the present time, the demand is limited but their practically life-time wear, resistance to fire, cold and heat, and non-fading qualities will probably overcome the price differential.

RAYON AND SILK CONSUMED in the United States

In addition to new fibres, the rayon industry took another step in creating its own identity and minimizing its characterization as a "substitute." While the industry had adopted the term *rayon* instead of artificial silk for its generic name, the fabrics made from the yarn continued to be described by fabric names created by the older fibres. In 1939, a committee of producers and wholesalers similar to the committee which coined the name rayon, prepared suggestions for renaming some of the more established rayon fabrics. *Trossach* was adopted for fabrics of the tweed family of combination yarns of rayon and wool and having cross-dye properties. Fabrics hitherto called *taffeta* and *pigment taffeta* were described as *twalle*, an Anglicized version of the French *toile*, meaning a plain weave. The official definition of *twalle* is "a fabric made of filament rayon with normal twist. Where *voile* twist is used, the fabric should be referred to as *crepe twalle*." The name *grenai* was selected for what had been previously described as *alpaca*.

The official definition is "the dress fabric of filament yarns, two-ply warp and filling of viscose crepe twist and acetate normal twist." The origin of the term is the term *grenadine* which refers to a tightly twisted crepe yarn. At the close of 1939, with fabrics almost completely turned over to rayon and with hosiery about to do so, rayon was rapidly reaching the place of first importance in the world's textile demands. (See also CELLULOSE PRODUCTS; INDUSTRIAL RESEARCH; RUBBER AND RUBBER MANUFACTURE; SILK AND SILK MANUFACTURE; TEXTILE INDUSTRY.) (I. L. BL.)

Read, Opie (1852-1939), U.S. author and humorist, was born December 22 at Nashville, Tenn. and spent his boyhood on his father's farm near there. At the age of 21 he went to Franklin, Ky. to work for a newspaper and in the meantime completed his college studies. From 1878 to 1881 he was editor of *The Arkansas Gazette* at Little Rock, and during the next two years he was on the editorial staff of *The Cleveland Leader*. Then he returned to Little Rock, where in 1883 he founded *The Arkansas Traveler*, a publication that became famous for its mélange of wit and cracker-barrel philosophy. He moved to Chicago in 1887, continued publication of the *Traveler* there for four years, and began work on a series of novels. Among his works are *A Kentucky Colonel* (1889), *A Tennessee Judge* (1893), *An Arkansas Planter* (1896), and *On the Suwannee River* (1900). Read died at Chicago November 2.

Reconstruction Finance Corporation,

one of the 10 agencies comprising the Federal Loan Agency, under the supervision of the Federal Loan administrator, may perform all functions it is authorized to perform under law to close of June 30, 1941, or such earlier date as the President may authorize. It

was created by "an Act to provide emergency financing facilities for financial institutions, to aid in financing agriculture, commerce, and industry, and for other purposes," approved Jan. 22, 1932, which may be cited as the "Reconstruction Finance Corporation Act." The powers of the corporation were increased and the scope of its operations extended or otherwise affected by

Reconstruction Finance Corporation—Summary of Activities Feb. 2, 1932 through Dec. 31, 1939

	Authorizations	Disbursements	Repayments and Other Credits
For benefit of agriculture	\$ 2,442,863,320.83	\$ 1,449,279,036.77	\$1,444,722,156.77
To open banks to meet demands of depositors	1,334,873,736.15	1,138,233,619.27	1,067,395,271.76
For distribution to depositors in closed banks	1,343,504,584.28	994,993,504.24	945,319,142.97
For bank capital (including Export-Import Banks)	1,397,194,680.00	1,169,930,001.56	629,993,674.14
For self-liquidating projects (including PWA municipal securities)	1,032,385,080.12	832,322,863.96	646,093,987.30
To business enterprises	518,926,255.00†	211,237,323.07	79,419,970.34
To drainage, levee, and irrigation districts	144,907,227.23	88,729,001.06	4,731,047.27
To railroads (including PWA railroad securities)	1,372,192,085.54	864,394,000.60	394,959,748.31
For loans to and capital of mortgage loan companies (including \$25,000,000 capital The RFC Mortgage Company and \$11,000,000 capital Federal National Mortgage Association)	672,505,040.39	491,492,789.87	334,462,224.35
For loans to and capital of insurance companies	138,014,750.19	125,168,209.81	95,942,132.53
To building and loan associations (including receivers)	157,297,637.75	120,355,820.50	117,913,530.30
To public school authorities	24,639,300.00	22,579,500.00	22,393,500.00
Catastrophe rehabilitation loans	16,184,520.05	12,003,955.32	10,335,283.04
To State funds for insurance of deposits of public moneys	13,087,715.88	13,064,631.18	13,064,631.18
For mining, milling, and smelting businesses	14,913,100.00	5,087,800.00	2,385,087.55
For other purposes	3,005,115.62	61,481,385	599,271.27
Total—By Directors of the Corporation	\$10,626,895,058.93	\$ 7,539,395,980.06	\$5,808,731,659.98
Allocations and loans to other governmental agencies and for relief by direction of Congress	2,921,413,841.73	2,920,902,909.37	2,774,405,334.83‡
GRAND TOTAL	\$13,548,308,900.66	\$10,460,298,889.43	\$8,583,136,994.81*

*Includes \$31,782,291.12 credited on indebtedness for property taken over for debt.

†Total loans to business of RFC and participating banks, \$575,920,566.16. Banks participations \$80,543,354.30, including \$23,549,043.14 RFC loans taken up by banks.

‡Includes \$2,720,243,677.07 cancellation of Corporation's notes pursuant to Act of Congress approved Feb. 24, 1938.

subsequent legislation.

The corporation was organized and began operations on Feb. 2, 1932. (E. SM.)

Red Cross, the internationally recognized symbol of agencies in various countries for relief of sufferers in war and civil calamities. Particularly the device of the International Red Cross formed in Geneva in 1864 to which 63 national societies are signatory to organize impartial aid for sick and wounded in time of war, and the League of Red Cross Societies with headquarters recently moved to Geneva which specializes in peacetime relief work.

The American Red Cross was organized in 1881 and signed the Geneva Convention in 1882. It carries on extensive disaster relief operations and, since founding, has expended \$143,000,000 to aid the victims of 2,495 disasters the world over. It is supported entirely by public contributions and has never been Government financed. It sponsors the American Junior Red Cross with a school boy and girl membership of 7,556,306, and since 1914 has awarded life saving certificates to more than 1,000,000 persons completing training courses, and since 1910 more than 2,000,000 certificates to persons instructed in first aid technique. Certificates have also been issued to more than 1,000,000 women and older girls who have taken Red Cross instruction in how to care for the sick at home.

To combat accidental injuries and deaths the American Red Cross has established more than 5,000 emergency highway first aid stations and mobile units, and annually gives instruction to approximately 10,000,000 householders on the removal of hazards likely to cause home and farm accidents.

In 1939 the American Red Cross provided food, clothing, shelter, rescue, medical and nursing aid and rehabilitation assistance to 130,000 victims of 157 disasters in the United States at an expenditure of \$2,276,109.

During the same period Red Cross public health nurses gave care to 272,729 persons and made 1,046,933 visits on behalf of the sick. In their school and pre-school work these nurses co-operated

with doctors in examining 595,575 children. In 477 communities 655 Red Cross nurses carried on this essential work, and 1,826 graduate nurse instructors taught classes in home hygiene and care of the sick to 61,296 persons who passed examinations on the subject. The first reserve of the Red Cross nurses' reserve corps was swelled to 15,000 picked women ready to act in any emergency of peace or war, and the total Red Cross nurses' reserve corps numbered 44,283.

Volunteers served a total of 1,430,213 hours in such specialized work as producing 342,849 garments for the needy; 5,061,082 surgical dressings and 18,395 Christmas bags for U.S. soldiers, sailors and Marines stationed overseas, 890,093 pages printed in Braille for distribution among blind readers.

Through field directors stationed at Army, Navy, Marine Corps and Coast Guard stations and Red Cross chapters, help was given in 1939 to more than 51,000 enlisted men. Through Red Cross workers in 3,479 chapters 150,606 war-disabled veterans were helped and other Red Cross personnel dealt with the problems of 53,792 ex-service men and their families.

In 1939 Red Cross chapters aided 134,103 civilian families with social and financial guidance, and 202 nutritionists and food experts assisted 82 Red Cross chapters throughout the country in passing along information on the value of health-protecting foods and adequate diets.

The American Red Cross has expended more than \$200,000 in Spain for the relief of civilian refugees, to repatriate American citizens, to help civilians fleeing from Spain to France and to purchase Government flour and wheat at a nominal price to feed starving non-combatants in Spain. It has also expended \$814,000 for wheat, medicine and surgical supplies to relieve the suffering of non-combatants in China, a fourth of which was contributed from its own treasury and the balance contributed by the public.

In line with Red Cross treaty obligations, the American society offered war relief aid to the belligerent nations, following the German-Polish hostilities Sept. 1, 1939. A program of making surgical dressings, clothing for refugees, and hospital garments was inaugurated among the chapters in the United States for relief of the victims of warfare. This voluntary effort by chapters was supported by their communities. The national organization appropriated \$75,000 for Polish war relief and sent \$25,000 for use of the American hospital in France. (G. S. Br.)

Refugees. Migrations of refugees during 1939 assumed unusual proportions. Military and political pressures intensified by the wars in Europe and the Far East uprooted millions of peoples from areas which they had occupied for generations. The 30,000,000 in China in continuing flight westward before the Japanese armies and the Spanish and Polish war refugees, quantitatively the greatest movements, were in the main internal migrations although some 400,000 Spanish refugees poured over the border into France and over 100,000 Polish refugees into Rumania, Hungary, and the Baltic countries. Refugees from Germany, Austria, and Czecho-Slovakia; Jews (non-Aryans), Protestants, Catholics, professionals, and members of outlawed political parties fled in increasing numbers from the persecutions and pressures of Nazi Germany which increased in ferocity and cruelty after the November riots in Germany in 1938.

Qualitatively the precipitate exodus from Germany heralding the outbreak of the war in Central Europe and disturbing to the peace and good order of other countries arrested world attention

DESOLATE CAMPS on French soil awaited the remnants of the Spanish Loyalist army in Catalonia after its flight across the border in Feb. 1939

in inverse ratio to the numbers of refugees involved. This was due in part also to the policies of the German Reich in fostering the spread of anti-Semitism in neighbouring countries and throughout the world, reducing thereby the limited opportunities for refugees to secure temporary admission to neighbouring countries or final settlement in overseas countries.

The previous migrations of the Turks, Greeks and Bulgarians planned and executed under bilateral treaties entered into by their governments presented lesser difficulties in contrast as these movements were to homelands where language, cultures and customs were familiar. On reaching their native countries these refugees were immediately accepted into their former citizenships and thus lost their character as refugees.

Russian and Armenian refugees, whose earlier flights had burst upon the world during a decade of rising economic activity, had in a sense set the patterns of refugee life for the German refugees. They had experienced the disadvantages of statelessness and the inhospitality of governments whose growing nationalisms tended to exclude the foreigner or to admit him only to uncertain civil status and the hardships of laborious employments.

The German, Austrian, Czech, Spanish and Polish refugees of 1939 were forced to find new homes in countries which had virtually closed their borders to immigration because of the depression in industry and agriculture, failure of domestic and foreign markets, and extensive unemployment. Throughout the world there was a population drift in process from rural areas into the cities to which it was assumed new immigrants would flock. The professional and urban character of the refugees seeking entrance confirmed the publics in the receiving countries in their fears of accretions to their urban populations. Considerations of the potential absorptive capacities of the receiving countries were too theoretical to induce them to admit thousands of newcomers who might bring with them racial, religious and economic conflicts of the Old World. In these world circumstances the refugees of 1939 found limited surcease in transit countries when admitted temporarily on humanitarian grounds and faced the necessity of immediate re-emigration to overseas countries for final settlement.

The refugees who had left Germany and Austria before the November riots of 1938 numbered approximately 130,000. At that time some 35,000 remained unassimilated in Western European countries. The annual rate of exodus from Germany had been 25,000.

During 1939 pressures in Germany were intensified enormously. In March when the German army moved into Prague German refugees previously resident in Czecho-Slovakia had to flee again and thousands of Czech non-Aryans and political refugees were added. Just previously Polish Jews in the Old Reich had been driven penniless and without notice over the Polish border. In the earlier stages of the German movement the neighbouring countries of Western Europe had received refugees in the expectation that they would find final settlement overseas. In the early months of the year these countries were forced to close their frontiers tightly against the onslaught of refugees.

Thereupon new methods of dispersion overseas were adopted. Passenger boats were loaded at German ports with refugees to be shipped South. These boats arrived unannounced in Latin and South American waters where many were unloaded on the desperate pleas of international and local refugee organizations. This overseas dispersion was dramatized in May 1939 by the refusal of Cuba to admit 927 refugees on the steamship "St. Louis," which was obliged to return to Europe with its human cargo. Thereafter boatloads of helpless refugees wandered in the waters of the Eastern Mediterranean seeking opportunities to disembark their passengers on the shores of Palestine. During this period Havana and Shanghai were virtually the only ports to which refugees without

relatives or friends to assist them to enter other countries in the process of infiltration could be admitted in any numbers. The application of immigration laws and procedures had become rigid throughout the world.

The German and Soviet invasions of Poland in Sept. 1939 added new millions of Poles and Jews to the restless wanderers in Europe. Over 100,000 Polish refugees fled into the Baltic and Southern European countries while within Poland Jews fled over the new Soviet frontier. German efforts to establish a reservation for Jews with Lublin as a centre, to drive Poles and Jews from the Polish areas incorporated into the German Reich and to return Germans from the Baltic countries precipitated new cross currents of moving populations.

Sir Herbert Emerson became League of Nations High Commissioner for Refugees coming under the protection of the League of Nations, on Jan. 1, 1939. In February he succeeded George Rublee as director of the Intergovernmental Committee of 32 governments organized on the initiative of the President of the United States who summoned the Evian Conference in July 1938. Just before his resignation George Rublee reported the German plan to organize orderly emigration to the Intergovernmental Committee, which voted to pursue its efforts to encourage the immigration of refugees by infiltration and to locate areas for mass settlement. Under its auspices commissions of experts were sent to Northern Rhodesia, British Guiana, the Dominican Republic and the Philippines. These commissions reported that the areas studied were feasible for settlement and recommended the initiation of trial settlements of approximately 500 families in each area.

The European war prevented the German plan of ordered emigration from going into effect. It soon appeared that Germany had not relaxed its pressures on the estimated 350,000 potential refugees still within its borders. In fact, the calling up of Jews remaining in Germany and the dispatch of the first trains of refugees from Vienna, Berlin and Prague to the Lublin reservation in former Poland, coupled with wholesale arrests, gave notice to the world that the exiles would not be absorbed in the war economy of the German areas.

In Oct. 1939 Sir Herbert Emerson estimated that from 1933 some 400,000 German refugees had left Germany, including Austria, the Sudetenland and Czecho-Slovakia, and that of these 250,000 had managed to find permanent homes. Palestine had absorbed approximately 70,000, the United States a similar number, with Western European, Latin and South American countries, Australia and China accounting for the remainder. However, there remained according to his judgment some 140,000 German refugees in the European countries awaiting final settlement overseas and 16,000 in overseas countries facing the necessity of re-emigration.

As the year 1939 came to a close trial settlements of German refugees were being organized in the Philippines (Island of Mindanao) and the Dominican Republic.

The British Government, which had accepted for temporary residence some 40,000 adult refugees and approximately 10,000 children, had established 108 tribunals to pass upon the loyalties of their alien guests. These tribunals were commissioned to determine which refugees were to be confined for the duration of the war and which would be granted limited freedom.

The French Government at the outbreak of the war had interned enemy aliens within its borders. The process of determining loyalties and the granting of privileges of residence and employment was proceeding more slowly in France.

The situation of refugees in Switzerland, Holland and Belgium had become more acute as a result of the war. Contributions to their support from private organizations in England and France had ceased because of exchange regulations. Holland and Belgium had found it necessary to appropriate public funds for the relief

of refugees and all the countries of Western Europe had ceased completely to receive further refugees. Sir Herbert Emerson in July 1939 had advised the government members of the Intergovernmental Committee that private funds were being exhausted by the demands of relief for refugees and that public funds would be required if the mass settlement projects under consideration were to proceed. He estimated that private groups and individuals had spent up to 1939 some £15,000,000 in assistance to German refugees alone. Within a few months after this statement there were many signs that private relief funds would prove inadequate even for relief needs and the prospect of substantial public and private funds for settlement projects waned.

Some 250,000 Spanish refugees remained in France awaiting plans for re-emigration. Many thousands had been repatriated to Spain, 6,000 had already migrated to Mexico, 2,500 to Chile, and 2,000 to the Dominican Republic planned as a reservoir for later re-emigration to Latin and South American countries.

The position of Russian and Armenian refugees, thousands of whom in 20 years were still stateless and unassimilated, worsened during 1939 as a result of the intensification of general anti-alien attitudes in all countries.

Confronted with the still unsolved German refugee problem the officers of the Intergovernmental Committee meeting in Washington in Oct. 1939 were invited by the President of the United States to pursue more extensive studies and surveys of larger areas for the settlement of the millions of additional refugees envisaged as a result of the Central European war. The Second Conference of American States Members of the International Labour Organization meeting at Havana in Nov. 1939 considered the problems of refugees and adopted a comprehensive report aimed at facilitating migration for settlement. The Conference also voted to convene the Permanent International Committee on Migration to consider ways and means of financing large scale settlement at an early date. Relief. The pall of a decade of unemployment, deepened by the recession of 1937 lifted somewhat in 1939, but in each English speaking country it remained the outstanding problem in relief. In England, the presence of a large number of men under 30 remaining continuously unemployed led the Unemployment Assistance Board to make a study of male beneficiaries 30 years or under, of whom it was found there were somewhat more than 100,000, of whom 58% had either had no employment in the previous three years or less than six months. About 40,000 were seen personally by members of the staff, with the assistance of one or more members of the local advisory committee. Eight and nine per cent were found physically or mentally disqualified for employment, of whom only about a quarter was remediable. Another group, as large as 40% in some localities, could have been placed, had the employment services told them of jobs available elsewhere. The largest single group consisted of unskilled workers who "can only offer to employers labour of a kind of which there is a superabundance." Vocational training and guidance, especially in the years immediately following school were considered the only remedy for this chronic and well known condition. And finally there was found a small group who refuse reasonable offer of work. Some seem to have other and unknown sources of income; some will take jobs only at wages and conditions that insure their failure. Recommendations for this group were of a repres-

sive or deterrent nature, such as to lessen the amount of relief; to turn it over to the wife of the unemployed man; to pay the grant not in cash but in food, clothing, etc., or to require the man to attend a local vocational centre.

In the United States, the same anxiety over the continuation of unprecedented numbers on relief rolls led almost uniformly to repressive, or deterrent measures. As the only relief project for which the Federal Government is wholly responsible is Works Progress Administration, popularly called WPA, it was at this segment of the relief program that a national policy could be instituted. In July, Congress passed several repressive measures, such as forbidding federally sponsored WPA projects which affected writings, dramatics, and music. But the most important legislative provision was the rule that all continuously employed on WPA for 18 months should be dismissed, and taken on again only at the close of one month and on re-application with its incident reinvestigation.

There were 775,000 men dismissed from the WPA rolls in July and August. As the rule is now a part of the law, a certain number fall under its provision each month. However, in September there were about 254,000 less workers on WPA than in August, a decrease not duplicated in the years 1937 or 1938. In 1938 there was an increase of 83,000 workers on the WPA payroll and in 1937 a drop of 55,000 in the same respective intervals.

In England the method used to examine the validity of relief payments to the unemployed was an inquiry of relief recipients in their own communities. In the United States, legislation was passed on the presentation of data by tax-paying groups and others interested in balancing the national budget, but with no inquiry among the recipients of aid.

In Canada, the only change in the basic law was in the line of liberalization. The plight of the transient labourer, dramatized in the United States by the most popular novel of the year, *The Grapes of Wrath*, was brought under relief protection by a provision of the Dominion Parliament offering to meet on a basis of equal sharing of costs any program for the care of transients a Province might wish to set up.

On the whole, and before the effect of the war could be noted, the trend of relief in these three countries has been downward from the new high reached in the winter of 1937-38. In September 1939 the estimated number of families in the United States receiving relief in all categories, local, State and Federal, both in the form of assistance and work was about 5,750,000, representing an estimated 15,500,000 persons, a low not equalled previously since Dec. 1937.

Statistics of Great Britain are not precisely comparable, referring principally to unemployment relief, but they show the same trend. In July 1939, the number of unemployed had dropped nearly 13% from July 1938 or from about 1,750,000 to 1,250,000, but need of relief to the unemployed remained about stationary for the reported 12 months, there being over 500,000 applicants at the beginning and the end of the period, while relief grants to applicants decreased during that period from £36,695,000 to £34,583,000, or somewhat over £2,000,000.

Canadian figures compare more closely with those of the United States in that they refer to all classes of recipients of relief, but they do not include those on work relief. The total number of persons in families receiving assistance in July 1939 was 805,654, compared with 836,556 in July 1938, and 793,271 in July 1937. The high for the previous 12 months was reached in March 1939 when it reached 1,027,536. The unique relief problem in Canada is the plight of its farmers in the wheat raising Provinces of Western Canada, especially Saskatchewan. While the situation there has not improved to the extent it was anticipated when the relief project was initiated in 1932, there has been some improve-

in inverse ratio to the numbers of refugees involved. This was due in part also to the policies of the German Reich in fostering the spread of anti-Semitism in neighbouring countries and throughout the world, reducing thereby the limited opportunities for refugees to secure temporary admission to neighbouring countries or final settlement in overseas countries.

The previous migrations of the Turks, Greeks and Bulgarians planned and executed under bilateral treaties entered into by their governments presented lesser difficulties in contrast as these movements were to homelands where language, cultures and customs were familiar. On reaching their native countries these refugees were immediately accepted into their former citizenships and thus lost their character as refugees.

Russian and Armenian refugees, whose earlier flights had burst upon the world during a decade of rising economic activity, had in a sense set the patterns of refugee life for the German refugees. They had experienced the disadvantages of statelessness and the inhospitality of governments whose growing nationalisms tended to exclude the foreigner or to admit him only to uncertain civil status and the hardships of laborious employments.

The German, Austrian, Czech, Spanish and Polish refugees of 1939 were forced to find new homes in countries which had virtually closed their borders to immigration because of the depression in industry and agriculture, failure of domestic and foreign markets, and extensive unemployment. Throughout the world there was a population drift in process from rural areas into the cities to which it was assumed new immigrants would flock. The professional and urban character of the refugees seeking entrance confirmed the publics in the receiving countries in their fears of accretions to their urban populations. Considerations of the potential absorptive capacities of the receiving countries were too theoretical to induce them to admit thousands of newcomers who might bring with them racial, religious and economic conflicts of the Old World. In these world circumstances the refugees of 1939 found limited surcease in transit countries when admitted temporarily on humanitarian grounds and faced the necessity of immediate re-emigration to overseas countries for final settlement.

The refugees who had left Germany and Austria before the November riots of 1938 numbered approximately 130,000. At that time some 35,000 remained unassimilated in Western European countries. The annual rate of exodus from Germany had been 25,000.

During 1939 pressures in Germany were intensified enormously. In March when the German army moved into Prague German refugees previously resident in Czecho-Slovakia had to flee again and thousands of Czech non-Aryans and political refugees were added. Just previously Polish Jews in the Old Reich had been driven penniless and without notice over the Polish border. In the earlier stages of the German movement the neighbouring countries of Western Europe had received refugees in the expectation that they would find final settlement overseas. In the early months of the year these countries were forced to close their frontiers tightly against the onslaught of refugees.

Thereupon new methods of dispersion overseas were adopted. Passenger boats were loaded at German ports with refugees to be shipped South. These boats arrived unannounced in Latin and South American waters where many were unloaded on the desperate pleas of international and local refugee organizations. This overseas dispersion was dramatized in May 1939 by the refusal of Cuba to admit 927 refugees on the steamship "St. Louis," which was obliged to return to Europe with its human cargo. Thereafter boatloads of helpless refugees wandered in the waters of the Eastern Mediterranean seeking opportunities to disembark their passengers on the shores of Palestine. During this period Havana and Shanghai were virtually the only ports to which refugees without

relatives or friends to assist them to enter other countries in the process of infiltration could be admitted in any numbers. The application of immigration laws and procedures had become rigid throughout the world.

The German and Soviet invasions of Poland in Sept. 1939 added new millions of Poles and Jews to the restless wanderers in Europe. Over 100,000 Polish refugees fled into the Baltic and Southern European countries while within Poland Jews fled over the new Soviet frontier. German efforts to establish a reservation for Jews with Lublin as a centre, to drive Poles and Jews from the Polish areas incorporated into the German Reich and to return Germans from the Baltic countries precipitated new cross currents of moving populations.

Sir Herbert Emerson became League of Nations High Commissioner for Refugees coming under the protection of the League of Nations, on Jan. 1, 1939. In February he succeeded George Rublee as director of the Intergovernmental Committee of 32 governments organized on the initiative of the President of the United States who summoned the Evian Conference in July 1938. Just before his resignation George Rublee reported the German plan to organize orderly emigration to the Intergovernmental Committee, which voted to pursue its efforts to encourage the immigration of refugees by infiltration and to locate areas for mass settlement. Under its auspices commissions of experts were sent to Northern Rhodesia, British Guiana, the Dominican Republic and the Philippines. These commissions reported that the areas studied were feasible for settlement and recommended the initiation of trial settlements of approximately 500 families in each area.

The European war prevented the German plan of ordered emigration from going into effect. It soon appeared that Germany had not relaxed its pressures on the estimated 350,000 potential refugees still within its borders. In fact, the calling up of Jews remaining in Germany and the dispatch of the first trains of refugees from Vienna, Berlin and Prague to the Lublin reservation in former Poland, coupled with wholesale arrests, gave notice to the world that the exiles would not be absorbed in the war economy of the German areas.

In Oct. 1939 Sir Herbert Emerson estimated that from 1933 some 400,000 German refugees had left Germany, including Austria, the Sudetenland and Czecho-Slovakia, and that of these 250,000 had managed to find permanent homes. Palestine had absorbed approximately 70,000, the United States a similar number, with Western European, Latin and South American countries, Australia and China accounting for the remainder. However, there remained according to his judgment some 140,000 German refugees in the European countries awaiting final settlement overseas and 16,000 in overseas countries facing the necessity of re-emigration.

As the year 1939 came to a close trial settlements of German refugees were being organized in the Philippines (Island of Mindanao) and the Dominican Republic.

The British Government, which had accepted for temporary residence some 40,000 adult refugees and approximately 10,000 children, had established 108 tribunals to pass upon the loyalties of their alien guests. These tribunals were commissioned to determine which refugees were to be confined for the duration of the war and which would be granted limited freedom.

The French Government at the outbreak of the war had interned enemy aliens within its borders. The process of determining loyalties and the granting of privileges of residence and employment was proceeding more slowly in France.

The situation of refugees in Switzerland, Holland and Belgium had become more acute as a result of the war. Contributions to their support from private organizations in England and France had ceased because of exchange regulations. Holland and Belgium had found it necessary to appropriate public funds for the relief

of refugees and all the countries of Western Europe had ceased completely to receive further refugees. Sir Herbert Emerson in July 1939 had advised the government members of the Inter-governmental Committee that private funds were being exhausted by the demands of relief for refugees and that public funds would be required if the mass settlement projects under consideration were to proceed. He estimated that private groups and individuals had spent up to 1939 some £15,000,000 in assistance to German refugees alone. Within a few months after this statement there were many signs that private relief funds would prove inadequate even for relief needs and the prospect of substantial public and private funds for settlement projects waned.

Some 250,000 Spanish refugees remained in France awaiting plans for re-emigration. Many thousands had been repatriated to Spain, 6,000 had already migrated to Mexico, 2,500 to Chile, and 2,000 to the Dominican Republic planned as a reservoir for later re-emigration to Latin and South American countries.

The position of Russian and Armenian refugees, thousands of whom in 20 years were still stateless and unassimilated, worsened during 1939 as a result of the intensification of general anti-alien attitudes in all countries.

Confronted with the still unsolved German refugee problem the officers of the Intergovernmental Committee meeting in Washington in Oct. 1939 were invited by the President of the United States to pursue more extensive studies and surveys of larger areas for the settlement of the millions of additional refugees envisaged as a result of the Central European war. The Second Conference of American States Members of the International Labour Organization meeting at Havana in Nov. 1939 considered the problems of refugees and adopted a comprehensive report aimed at facilitating migration for settlement. The Conference also voted to convene the Permanent International Committee on Migration to consider ways and means of financing large scale settlement at an early date. Relief. The pall of a decade of unemployment, deepened by the recession of 1937 lifted somewhat in 1939, but in each English speaking country it remained the outstanding problem in relief. In England, the presence of a large number of men under 30 remaining continuously unemployed led the Unemployment Assistance Board to make a study of male beneficiaries 30 years or under, of whom it was found there were somewhat more than 100,000, of whom 58% had either had no employment in the previous three years or less than six months. About 40,000 were seen personally by members of the staff, with the assistance of one or more members of the local advisory committee. Eight and nine per cent were found physically or mentally disqualified for employment, of whom only about a quarter was remediable. Another group, as large as 40% in some localities, could have been placed, had the employment services told them of jobs available elsewhere. The largest single group consisted of unskilled workers who "can only offer to employers labour of a kind of which there is a superabundance." Vocational training and guidance, especially in the years immediately following school were considered the only remedy for this chronic and well known condition. And finally there was found a small group who refuse reasonable offer of work. Some seem to have other and unknown sources of income; some will take jobs only at wages and conditions that insure their failure. Recommendations for this group were of a repres-

sive or deterrent nature, such as to lessen the amount of relief; to turn it over to the wife of the unemployed man; to pay the grant not in cash but in food, clothing, etc., or to require the man to attend a local vocational centre.

In the United States, the same anxiety over the continuation of unprecedented numbers on relief rolls led almost uniformly to repressive, or deterrent measures. As the only relief project for which the Federal Government is wholly responsible is Works Progress Administration, popularly called WPA, it was at this segment of the relief program that a national policy could be instituted. In July, Congress passed several repressive measures, such as forbidding federally sponsored WPA projects which affected writings, dramatics, and music. But the most important legislative provision was the rule that all continuously employed on WPA for 18 months should be dismissed, and taken on again only at the close of one month and on re-application with its incident reinvestigation.

There were 775,000 men dismissed from the WPA rolls in July and August. As the rule is now a part of the law, a certain number fall under its provision each month. However, in September there were about 254,000 less workers on WPA than in August, a decrease not duplicated in the years 1937 or 1938. In 1938 there was an increase of 83,000 workers on the WPA payroll and in 1937 a drop of 55,000 in the same respective intervals.

In England the method used to examine the validity of relief payments to the unemployed was an inquiry of relief recipients in their own communities. In the United States, legislation was passed on the presentation of data by tax-paying groups and others interested in balancing the national budget, but with no inquiry among the recipients of aid.

In Canada, the only change in the basic law was in the line of liberalization. The plight of the transient labourer, dramatized in the United States by the most popular novel of the year, *The Grapes of Wrath*, was brought under relief protection by a provision of the Dominion Parliament offering to meet on a basis of equal sharing of costs any program for the care of transients a Province might wish to set up.

On the whole, and before the effect of the war could be noted, the trend of relief in these three countries has been downward from the new high reached in the winter of 1937-38. In September 1939 the estimated number of families in the United States receiving relief in all categories, local, State and Federal, both in the form of assistance and work was about 5,750,000, representing an estimated 15,500,000 persons, a low not equalled previously since Dec. 1937.

Statistics of Great Britain are not precisely comparable, referring principally to unemployment relief, but they show the same trend. In July 1939, the number of unemployed had dropped nearly 13% from July 1938 or from about 1,750,000 to 1,250,000, but need of relief to the unemployed remained about stationary for the reported 12 months, there being over 500,000 applicants at the beginning and the end of the period, while relief grants to applicants decreased during that period from £36,695,000 to £34,583,000, or somewhat over £2,000,000.

Canadian figures compare more closely with those of the United States in that they refer to all classes of recipients of relief, but they do not include those on work relief. The total number of persons in families receiving assistance in July 1939 was 805,654, compared with 836,556 in July 1938, and 793,271 in July 1937. The high for the previous 12 months was reached in March 1939 when it reached 1,027,536. The unique relief problem in Canada is the plight of its farmers in the wheat raising Provinces of Western Canada, especially Saskatchewan. While the situation there has not improved to the extent it was anticipated when the relief project was initiated in 1932, there has been some improve-

A UNIQUE EXPERIMENT in relief was begun May 16, 1939, at Rochester, N.Y., to solve the dilemma of hungry citizens and surplus food. For each \$1.00 in "food stamps" purchased by relief clients, they received 50 cents' worth of stamps redeemable only for foods designated as "surplus"

ment. In that Province 46,506 or 86.5% of the Dominion total of 53,302 agricultural dependents reside.

The fiscal policies of the countries under review remained unchanged during the period under review. Great Britain alone paid all the cost of relief from current income; both Canada and the United States rely in part on borrowed money. Grants-in-aid by the central government to local units are provided by all three countries largely because the central governments alone have the necessary resources to meet the extraordinary relief demands.

Administration is decentralized in Canada, the Dominion Government laying down conditions to be met by localities to qualify for grants-in-aid; but localities taking responsibility for administration. In the United States there are three systems: WPA is wholly centralized; the categorical classes under the Social Security Act—blind, aged and children—are administered under grants-in-aid; general relief is left with localities, with State aid in some instances. In England, unemployment relief is centrally administered, with local, voluntary advisory committees; relief to others is under local administration, supervised by grants-in-aid from the central government to local authorities. (See also MUNICIPAL GOVERNMENT; SOCIAL SECURITY; UNEMPLOYMENT; WORKS PROGRESS ADMINISTRATION.)

Religion. The most important fact in the religious life of the Catholic Church during 1939 was the death on February 10 of Pope Pius XI, scholar, statesman and saint. His administration of his high office was a notable one, most of all for this, that it put an end to the long dispute between the curia and the quirinal and re-established the papacy as an independent political power, master in its own house.

Two political events during 1939 had an intimate bearing upon the fortunes of the Roman Church. The first was the ending of the Spanish Civil War by the victory of General Franco; the second, the outbreak of the European war with its consequence in the defeat and virtual annihilation of Poland as an independent

State. The Franco victory was welcomed by the Vatican, which from the first had shown its sympathy with the insurgents, a sympathy openly expressed when Pope Pius XII received the returning Italian troops at the Vatican and gave them his blessing "as defenders of civilization."

The Polish debacle, on the other hand, was recognized as a severe blow to the church; a blow all the more disastrous because it meant the transfer to Russia, and so exposure to the menace of bolshevism, of many millions of Polish Catholics.

In Germany, the strained conditions which had existed between the Government and the churches both Catholic and Protestant, still continued. But the repressive measures of the Government did not succeed in breaking the spirit of independence either of the Catholic bishops or of the independent Protestants. It is too soon to say what effect the outbreak of the European war will have on the relations of the Government to the churches. But it seems not unlikely that it will cause some relaxation of the Government's oppressive policy in the interest of national unity. Pastors of all branches of the church have been drafted into service as chaplains and the difficulties of the home congregations have been correspondingly increased.

Martin Niemoeller still continued in confinement in 1939. The statement widely made that he sought release from captivity by offering to serve as a volunteer in submarine service, proves to be without foundation. The fact is that Niemoeller is a reserve officer in the German navy and told his wife that if called up he should feel it his duty to serve. The German Government, however, evidently concluded that the risk of releasing him was too great, and he remains in concentration camp.

The growing attacks upon religion by the rulers of Russia and Germany have caused a corresponding rapprochement between the leaders of the Catholic and Protestant churches. This new spirit of sympathy found impressive illustration in an encyclical of Pius XII in which he called upon all Christians to unite in prayer for their persecuted fellow Christians.

In the non-Roman churches the movement for practical co-operation made notable progress. Landmarks are the World Conference of Madras of Dec. 1938 and the Amsterdam Conference of July 1939.

The Madras Conference, in 1938, held at the initiative of the International Missionary Council, brought together at Madras in India, some 400 delegates drawn in equal numbers from the younger churches in the so-called mission field, and the older churches in the home field. Taking its departure from the findings of the Oxford and Edinburgh Conferences, the Madras Conference considered in some detail the application of these principles to the new problems faced by the churches of Africa and of the Far East. The conference was notable for its strong pronouncement in favour of church unity; a pronouncement rendered more impressive by the presence of large delegations from the churches of China and Japan. The conference also approved the appointment of Dr. William Paton, an officer of the International Missionary Council, as one of the secretaries of the proposed World Council of Churches.

The Amsterdam Conference was held under the joint auspices of the World Alliance for International Friendship Through the Churches and the Provisional Committee of the World Council. It brought together at Amsterdam, in July, some 1,300 delegates of young people's societies from 70 countries, denominational and interdenominational. While the strained conditions under which the conference met made the adoption of formal resolutions inexpedient, the gathering gave an impressive demonstration of the extent to which the young people of different countries feel themselves, in spirit, at one.

The week before the Amsterdam Conference opened, the admin-

istrative committee of the World Council met at Zeist in Holland to decide when and where the first meeting of the proposed World Council should be held. It was reported that 53 churches, including representatives of Orthodox, Old Catholics, Episcopalians, Reformed, Lutherans, Congregationalists, Disciples and Baptists, had already given their approval to the Movement and that its success seemed to be assured. It was therefore decided to call the first meeting for the fall of 1941 and to approve the holding of this meeting in America, if that should prove acceptable to the American churches.

All these developments, in themselves encouraging, have been overshadowed by the coming of war. At no point is the change in the attitude of the churches more apparent than in the spirit in which they have met this new crisis. Where 25 years ago the churches with scarcely an exception approved the action of their Governments in declaring war and confidently expected that the victory of the Allies would promote the moral ends to which they were committed, they now look upon war as the great enemy, involving in its disastrous train victors and vanquished alike. As yet, however, there is no unanimity as to what this new attitude should mean for the responsibility of the churches. There is general agreement at least in all countries where freedom of expression is still allowed, that all peoples share the blame for the causes which have produced the European war. There is equal agreement as to the type of social order which the church should hold up as the ideal, but there is still a difference of opinion as to the way in which this goal is to be reached. A convinced minority believe that war in any form is futile and so take the pacifist's position. The majority believe that there are evils so far-reaching that they must be resisted even at the cost of war and so even though it be with heavy hearts, they lend their support to their Governments in the European conflict. In the United States where sympathy with pacifism is for the moment especially strong, great denominations like the Methodists and Protestant Episcopalians have gone on record in support of the conscientious objector, while in the Presbyterian Church in the U.S.A. (the Northern Presbyterian Church), an amendment removing from the Confession of Faith the phrase "lawful war" was defeated by only a small majority. (See also CHURCH REUNION.) (W. A. BR.)

Representatives, House of: see CONGRESS, UNITED STATES.

Republican Party. As it entered 1939, the Republican Party, both encouraged and strengthened by gains scored in the elections of Nov. 1938, prepared to play a more active part in national affairs. When the 76th Congress assembled on Jan. 3, 1939, the Republicans held 23 Senate and 169 House seats. Eighteen States had Republican governors—a gain of 11, and in State and local governments the number of Republicans holding elective office had greatly increased. Senator Charles L. McNary of Oregon and Representative Joseph W. Martin, Jr., of Massachusetts, continued, respectively, as Republican Senate and House leaders.

John D. M. Hamilton remained at the helm of the Republican National Committee and Franklyn Waltman, a former newspaper man, continued as its director of publicity. Through its research division, under the direction of Olin Glenn Saxon, professor of economics at Yale, the National Committee prepared factual studies on current issues. These were made available to Repub-

licans in Congress and party workers throughout the country. Representative J. William Ditter of Pennsylvania served as chairman of the Republican Congressional Committee and Senator John G. Townsend, Jr., of Delaware headed the Republican Senatorial Committee.

Preparation for the 1940 campaign was the principal objective of the national organization.

With their numbers nearly doubled, Republicans in Congress showed increased activity. On several occasions, they joined with independent Democrats to defeat or sidetrack important Administration measures. With the help of independent Democrats, Republicans in Congress defeated the Administration's \$3,800,000,000 spend-lend program, forced the enactment of a tax revision measure to relieve business of certain burdensome levies, won a revision of the Social Security Act to "freeze" the payroll taxes at their present levels, and modify plans for a \$47,000,000,000 reserve fund, assisted in passing the Hatch "pure politics" bill to prohibit electioneering by all Federal officeholders, and supported a Congressional investigation of the NLRB.

Despite virtually solid Republican opposition, the Administration won its fight to continue until Jan. 15, 1941, the \$2,000,000,000 Stabilization Fund, and to continue the power of the President to alter the gold content of the dollar. In the Senate, many Republicans voted for the amendment offered by Senator Alva Adams, Democrat of Colorado, to fix the price for newly-mined domestic silver at 77.57 cents an ounce, instead of 64.64 cents.

To help formulate Republican policy, Minority Leader Martin appointed five special study committees. These committees, with their chairmen, were as follows: national defence, Representative James W. Wadsworth, New York; extraordinary powers of the President, Representative Jesse P. Walcott of Michigan; national debt policy, Representative Daniel A. Reed of New York; agriculture, Representative Clifford R. Hope, Kansas; and reciprocal trade agreements, Representative Allen Treadway, Massachusetts.

During the regular session, Republicans in Congress made it plain that they would oppose American involvement in European power politics. Following the outbreak of the European war, the President, in September called Congress into extra session to revise the neutrality law and repeal the arms embargo. Though several leading Republicans, including Senators Taft, Austin, Bridges and Representative James W. Wadsworth of New York supported the Administration's neutrality proposals, a majority of Republicans in both Houses voted to retain the arms ban.

Scattered State and local elections on November 7 seemed to indicate that the Republican Party had lost no ground in favour with the voters since the national elections of 1938. In Philadelphia, the Republican candidate for mayor, Robert E. Lamberton, defeated his Democratic opponent, Robert C. White. In Cleveland, Mayor Harold H. Burton, Republican, was elected for his third consecutive term. Commenting on the elections, Chairman Hamilton, in a statement issued on November 8, said:—"With only a few exceptions, Republicans maintained or increased their strength compared with a year ago, notably in Pennsylvania, New Jersey and other Eastern States. . . . The failure of the New Deal to restore the country to economic recovery was made the issue in a number of local contests where the Republicans won." Since the 1936 campaign, Hamilton revealed, the party debt had been reduced from \$1,200,000 to approximately \$655,000.

The Republican National Convention in a presidential election is usually held the second week in June, the Democrats meeting about two weeks later. A proposal for a later meeting date in 1940, either in June or August, had the support of many leaders. The Executive Committee had no authority to fix the convention date. This was to be done by the full Committee when it met early in 1940. (See also ELECTIONS; UNITED STATES.) (O. McK.)

Retail Sales. The sales for 1939 of all types of United States retail stores will show an estimated increase of approximately 6½% over 1938. The fiscal year of most retail stores ends January 31 and as a consequence the percentage of increase in January sales must be estimated. The largest sales increases in dollar volume were shown by the two major combination retail-mail order companies. During the first six months in 1939 the increase in retail sales was nominal. Beginning with July, however, the percentage of increase became larger and each subsequent month continued to show relatively larger increases than were shown during the first six months in 1939.

The increase in 1939 was not only in dollar volume but also in the number of transactions, since the estimated increase in number of unit sales made by retail stores in 1939 was approximately 4% greater than in 1938.

There was also a slight increase in the dollar value of each transaction. This was not due primarily to an increase in retail prices but rather to the increase in consumer buying power which permitted the purchase of more units of merchandise in the medium and upper brackets. Save for a brief period of a few weeks after the declaration of the European war, when prices on some commodities rose sharply, there was little if any increase in retail prices generally.

The increase in sales volume in 1939 over 1938 brought a drop in the operating expenses of retailers of about 2% and the average for the year 1939 of operating expenses for department stores and specialty stores will approximate 33% as compared to 35% for the year 1938.

Retailers faced the close of their 1939 fiscal year with their inventories in a satisfactory position. Although the inventories averaged 8% to 10% more in dollar value than they were in 1938, this was not out of line with the expected increases in sales that will probably be obtained in the early months of 1940, since it is expected that the increase in sales in the early period of 1940 over 1939 will range from 5% to 10%.

Based on financial statements issued for the first three quarters, there was a substantial increase in net profit on sales for the year 1939 as compared to 1938. It is estimated that the best managed department and specialty stores and those in more strategic positions obtained a 5% net profit on their retail sales for the fiscal year 1939, whereas in 1938 the net profit of most of the larger stores where profits were shown, was less than 3% on their retail sales.

The control of operating expenses in 1940 will still be a major problem for retailers in view of the higher prevailing wage levels, the tendency to shorter hours, and the prospect of additional taxes. Moreover, retailers will be greatly concerned if there is any substantial advance in consumer commodity prices that may be reflected in higher retail prices, since unless these are nominal and gradual, consumer purchasing power will be inadequate to absorb the increase and thus enable retailers to maintain the expected increase in their sales volume during the early part of 1940. Rheumatism: see ARTHRITIS.

Rhode Island, one of the original States of the United States, popularly known as "Little Rhody"; area, 1,248 sq.mi. (smallest of the United States); population accord-

ing to the U.S. census of 1930 was 687,497 and 680,712 in the 1936 State census. Of the latter figure, 525,232 were native white, 144,952 were foreign-born white comprising 30,093 Italians, 33,105 French Canadian, 20,458 English, 13,459 Irish, 6,355 Polish, 5,133 Scottish; 10,528 were Negroes and others. The urban population in 1930 (U.S. census) was 635,429, or 92.4% and in 1936 (State census) was 578,206 or 85%.

The cities are Providence (capital), which (1936) had a pop. of 243,006; Pawtucket, 72,820; Woonsocket, 46,822; Cranston, 44,533; Newport, 29,202; Warwick, 27,072; Central Falls, 23,996.

History.—At the regular 1939 session of the legislature, leading measures passed were: act reorganizing the State departments by revising the reorganization act of 1935; act creating a civil service system and a resolution proposing a civil service amendment to the Constitution; act allowing the mayor of Providence greater appointive power and providing for a charter commission to draft a charter revision proposal for Providence; act appropriating money for investigation of voting frauds; acts creating commissions to study and report upon juvenile and district court legislation, election and caucus laws, direct primary and corrupt practices acts, labour legislation, division of Providence into five senatorial districts; annual appropriation bill reducing State expenditures by more than \$1,000,000; acts levying a tax on cigarettes and all other tobacco products, increasing inheritance tax and increasing tax rates on electric and communications utilities; act exempting from local taxation idle mill and manufacturing property; act creating a board of trustees for State colleges but reserving to the legislature control over the fiscal affairs of the institutions; act permitting group hospitalization; acts permitting certain municipalities to rehabilitate hurricane-damaged beaches; act ceding land to the Federal Government for a naval air base; act changing date for registration of automobiles to April 1; act banning the use of "loss-leaders" in retail trade; resolution proposing a constitutional amendment banning dual office-holding.

The chief officers of the State were: William H. Vanderbilt, governor; James O. McManus, lieutenant-governor; J. Hector Paquin, secretary of State; Louis V. Jackvony, attorney-general; Thomas P. Hazard, general treasurer; Edmund W. Flynn, chief justice of the Supreme Court.

Education.—During 1938–39 there were in the public elementary schools 68,790 pupils and 2,269 teachers; in junior high schools 25,449 pupils and 1,007 teachers and in senior high schools 23,302 pupils and 976 teachers. There were in private and parochial elementary schools, 23,634 pupils; in junior high schools, 4,589 pupils, and in senior high schools 6,033 pupils. Teachers in private and parochial schools numbered 1,252.

Charities and Correction.—During 1939 there were handled by the State department of Social Welfare 6,800 cases of old age assistance, 1,150 cases of aid to dependent children, 150 cases of soldiers' relief, 60 cases of aid to the blind and 8,300 cases of State unemployment relief. Under same department were institutions: mental hospital, 2,773 inmates; infirmary, 820; school for feeble minded, 731; home and school, 206; correctional school for girls, 37; correctional school for boys, 116; soldiers' home, 68; reformatory for men, 117; reformatory for women, 20; prison, 268.

Banking and Finance.—In the State there were 35 banking institutions. Resources of 23 banks under State supervision totalled \$447,915,110, and of 12 banks under Federal supervision, \$111,309,207. Savings deposits in savings banks and trust companies amounted to \$315,690,553, representing 398,664 depositors June 30, 1939. In addition, five loan and investment companies had resources of \$8,730,530; eight building and loan associations, \$37,261,999; 14 credit unions, \$3,108,838.

Agriculture.—In 1935, the farm population was 21,751 in con-

trast with 16,477 in 1930. All land in farms, 307,725 acres; 4,327 farms; value, \$35,237,660. Crop production estimate by acres and quantity, report of Rhode Island department of agriculture and conservation for year 1938, indicated: tame hay, 45,000ac., 58,000 tons; potatoes, 3,900ac., 624,000bu.; apples, 308,000bu.; peaches, 27,000bu.; pears, 11,000bu.; grapes, 220 tons. Livestock, 23,159 dairy cows producing 142,000,000lb. of milk; 320,000 hens (1937) producing 2,910,000 dozen of eggs.

Industry and Business.—The United States census of business for 1935 shows that there were in the State 165,024 employees receiving a payroll of \$181,309,000. Retail business employed 28,881 with a payroll of \$27,671,000. Wholesale employed 6,328; insurance, real estate and finance, 4,976; service, 3,210; hotels, 1,288; mines and quarries, 175; construction, 2,299. Manufacturers employed 112,518 in 1,429 manufacturing establishments with a payroll of \$120,070,000. The census of manufacturers for 1937 listed 1,409 establishments employing 108,031 workers producing goods valued at \$517,196,193, and paying in wages \$112,933,084. More than 50% were employed in the textile industry, there being 309 textile plants employing 57,050 workers, manufacturing goods valued at \$259,603,426. (M. C. Mr.)

Rhodesia. Area 440,656 sq.mi.; comprises two territories in Africa, of the British Empire, *viz.* Southern Rhodesia and Northern Rhodesia. Certain essential statistics are given in the table below. See also BRITISH EMPIRE.

History.—Southern Rhodesia is a self-governing member of the British Commonwealth but supervision over native rights is reserved to the Imperial Government. Northern Rhodesia remains a dependency of the Crown. The Royal Commission on the question of closer union between the Rhodesias and Nyasaland issued its report early in 1939.

The commission recommended closer co-operation between the three territories but left amalgamation of the Rhodesias to be decided in the future after a period of parallel development. It suggested that the union of Northern Rhodesia and Nyasaland might take place at an early date.

A general election for the Southern Rhodesia parliament party was held in April. The United party led by Mr. Huggins, the prime minister, was returned to power with 23 seats out of 30. Labour held 7 seats but neither the Rhodesian nor the Union parties secured seats.

All ministers of the previous Government were re-elected. The prosperity of Southern Rhodesia seems assured. In 1938 gold exports reached the record value of £5,718,000 and export trade in general showed a favourable balance of £2,000,000.

Since the outbreak of war the defences of the country have been strengthened and forces for sending overseas are under training. Over two-thirds of the European male population volunteered for service and conscription was introduced more to prevent depletion of vital industries than for military purposes. Over 100 airmen were sent out of the country for training. The prime minister and the minister for defence visited the United Kingdom to discuss defence and other questions.

The copper industry continues to assure the prosperity of

Northern Rhodesia. At the outbreak of war the price of copper was controlled and the whole of the output taken over by the Government. A five-year plan for the development of social services in Northern Rhodesia provides an expenditure of £1,000,000 on capital works also for an increase in current expenditure.

Expansion of local government through the native authorities continues. More money was set aside for native treasuries from which schools and other social services will be financed. Grants were made from the Colonial Development Fund for the construction of ground facilities for aircraft, also for native hospitals and dispensaries. 1,423,600 acres of land were acquired from the British South Africa Company for the benefit of the native people. (J. L. K.)

Rhodes Scholarships. The American Rhodes Scholarships were suspended by the Rhodes Trustees in Sept. 1939 as a result of the war. The 1939 elections have been postponed and it is not likely that any elections will be held until the end of the war.

There were 96 Rhodes Scholars who would normally have spent the year 1939 at Oxford. Immediately after the opening of hostilities the 1939 Scholars-elect were ordered to remain in the U.S.; the 1937-38 Rhodes scholars in residence in Oxford returned to the United States as soon as accommodations could be obtained after declaration of war. Scholarships in force are only suspended and will be resumed when possible. (F. Av.)

Ribbentrop, Joachim von (1893—), German statesman. The son of a former lieutenant-colonel, descended from a family long connected with the German army, he was born April 30 at Wesel on the Rhine and was educated at the gymnasium at Metz. Later he studied languages for several years at Grenoble and London, then went to Canada in 1910 as an independent merchant. He returned to Germany after the outbreak of the World War and enlisted in a Hussar regiment. Serving on both eastern and western fronts and in Turkey, he was wounded, advanced to lieutenant-colonel, and by the end of the war was attached to the war ministry. After being mustered out of the army he returned to business life as a wine merchant and established an influential import and export firm. He first became identified with the Nazi party as a worker in 1930. In his home in Berlin-Dahlem were held the important meetings that preceded Hitler's appointment as Chancellor of the Reich Jan. 30, 1933. Until May 1935 Ribbentrop was a commissioner of the Reich on disarmament problems, then he was appointed ambassador-at-large. From 1936 to 1938 he was ambassador to Great Britain, and on Feb. 4, 1938, five weeks before Hitler marched into Austria, he was appointed foreign minister. Ribbentrop, who had concluded the anti-Comintern pact in 1936, also negotiated its antithesis, the Nazi-Soviet pact of non-aggression in 1939, and personally went to Moscow to sign it August 24. He played a prominent role in the negotiations with Britain prior to the beginning of the European war, and thereafter was Hitler's intermediary in Moscow, signing for Germany the Nazi-Soviet partition agreement of September 29.

Territory and Area in sq. mi.	Principal Products in 1938 (in metric tons).	Imports and Exports 1938 (in thousand £).	Road and Rail 1938.	Revenue and Expenditure (in thousand £).	Education: Elementary and Secondary 1938.

Rice. World production of rice in 1939 was generally below 1938. The 1939 Chinese crop was predicted in consular reports 5 to 10% smaller.

The Chinese crop of 1938 was 2,811,000,000 bushels. Burma crop would be 10 to

15% below normal due to floods (1939). The 1938 Burma crop was 400,400,000 bu. Drought was reported to have cut the 1939 Chosen crop 25 to 35%; the 1938 crop was 220,000,000 bushels. The 1939 Japanese crop was estimated Sept. 20 as 588,000,000 bu. compared to 599,000,000 bu. in 1938. The 1939 Taiwan crop was 36,662,000 bu. compared to 44,433,000 bu. (1938). Italy, the largest surplus-rice producing country of Europe, had a bumper 1939 crop, 40,800,000 bu. compared to 40,090,000 bu. in 1938. The price of the Italian crop was fixed to start at \$1.02 a bushel and finish at \$1.10.

Rice Production in the United States
(As reported Nov. 1, 1939, by Department of Agriculture)

	1939 bu.	1938 bu.	Average 1928-37 bu.
Total U.S.	52,204,000	52,303,000	43,387,000
Louisiana	20,812,000	20,748,000	18,128,000
Texas	13,932,000	13,005,000	9,215,000
Arkansas	9,180,000	9,450,000	8,178,000
California	8,280,000	9,100,000	7,827,000

Exports from the United States during the rice-marketing year ending July 31, 1939, were the highest in ten years, 326,122,000 lb. in terms of cleaned rice. Of this, Cuba, the largest customer, took 203,261,000 pounds.

(S. O. R.)

Richtmyer, Floyd Karker

(1881-1939), U.S. physicist, was born at Cobleskill, N.Y. on October 12 and received his education at Cornell university, where he taught from 1906 until his death and was dean of the graduate school after 1931. He was internationally recognized by men of science for his study of X-rays and for his development of the laws of X-ray absorption in matter. He was chairman of the division of physical sciences of the National Research council (1930-35), president of the American Physical society (1936), of the Optical Society of America (1920), and of the American Association of Physics Teachers (1937-39). Among his honours was the Levy medal (1929) of the Franklin institute, Philadelphia. He died November 7 at Ithaca, New York.

Rinfret, Fernand

(1883-1939), Canadian statesman, was born February 28 at Montreal. In 1907 he became parliamentary correspondent for *Le Canada*, and he was editor of this French-Canadian journal from 1909 until 1926. He was first elected to the House of Commons in 1920 and was re-elected five times. Prime Minister Mackenzie King appointed him secretary of State in 1926, and he served in this position until 1930. From 1932 to 1934 he was mayor of Montreal. King again appointed him to his cabinet in 1935 as secretary of State, in which post he continued until his death at Los Angeles, Calif., on July 12.

Rio de Oro: see SPANISH COLONIAL EMPIRE.

Rio Muni: see SPANISH COLONIAL EMPIRE.

Rivers and Harbours.

Improvements of rivers, harbours, and other waterways of the United States for navigation are prosecuted by the Corps of Engineers, U.S. Army, under the direction of the secretary of War and the supervision of the chief of engineers, in accordance with plans authorized by the Congress. Approximately 1,000 river and harbour projects were in force on June 30, 1939. New work was undertaken on 177 projects and 48 were completed during 1939. Active maintenance operations were under way at 296 localities. Total expenditures during the fiscal year were \$117,700,000, of which \$77,600,000 was for new work. The total net water-borne commerce during 1938 over federally-improved waterways and

harbours of the United States, after eliminating all known duplications, was 466,900,000 short tons valued at \$17,019,000,000.

The principal items of new work in progress during 1939 on rivers and harbours, exclusive of that on canals and inland waterways, include construction of a 40-ft. channel at Boston harbour; the enlargement of the Hudson River channel to a 48-ft. depth between West 40th and West 54th streets; the deepening of Bay-side-Gedney channel to 35 ft.; the deepening of Bay Ridge channel to 40 ft.; the improvement of the New York-New Jersey channels to provide a controlling depth of 35 ft.; the deepening of Buffalo bayou at Houston, Tex., to 34 ft.; the widening of Cuyahoga river at Cleveland harbour; and the general enlargement of channels at Fairport, Ohio, and Buffalo, New York.

Additional dikes for contraction works and dredging for channel correction at the Southwest pass, mouth of the Mississippi river, were under way. On the North Pacific coast the south jetty at the mouth of the Umpqua river was extended, a 26-ft. channel at the mouth dredged and a 22-ft. channel to Reedsport started; an auxiliary jetty was under construction at the mouth of the Columbia river; the 15-ft. deep, 300-ft. wide channel on the Columbia river between Vancouver and Bonneville was started; fish lock machinery was installed at Bonneville dam; and reconstruction of the Grays harbour jetties continued.

Major works completed include a 40-ft. channel in the Hudson river at New York for full river width from Ellis island to 59th street; a 20-ft. channel along the New Jersey pierhead line from Kill Van Kull to Anchorage channel; construction of a 35-ft. deep turning basin at Hollywood harbour, Fla.; the widening and deepening of the turning basin at Miami; a 25-ft. channel in the Cape Fear river to Navassa, N.C.; channel deepening at Bridgeport, Conn.; deepening of Egmont Relocation channel at Tampa, Fla., to 32 ft.; construction of a 32-ft. channel at Mobile, Ala.; the Galveston, Tex., project providing 34 ft. to Bolivar Roads and thence 36 ft. to deep water in the Gulf of Mexico; the outer harbour, channel and turning basin at Lorain, Ohio; the harbour at Conneaut, Ohio; a sand barrier at Crescent City, Calif.; the widening of the 30-ft. channel of the San Joaquin river below Stockton, Calif., and the upper settling basin near that city; a 24-ft. deep, 200-ft. wide channel at Rainier, Ore.; and a 40-ft. outer harbour turning basin at Los Angeles, California. (See also CANALS AND INLAND WATERWAYS; FLOODS AND FLOOD CONTROL; WATER POWER.)

(J. L. S.)

British Isles.—The steady progress in the development of accommodation for shipping which has characterized British port policy during recent years was abruptly arrested in the early autumn of 1939 by the outbreak of hostilities with Germany, and for the last four months of the year there was a practical cessation of all activities which were not essential to the prosecution of the war, though certain works which were well advanced towards completion were allowed to be continued. The interruption, indeed, was actually earlier than the outbreak of war, because for months beforehand, right back, in fact, to the beginning of the year, the shadow of the impending disaster hung over the country and port authorities were reluctant to undertake schemes, the success of which would be dubious in view of the rapid approach of conditions likely to affect maritime commerce adversely to a very marked degree. Moreover, they were called upon to expend considerable sums of money on protective works and to train their staffs to deal with emergency conditions. The Port of London Authority, for example, spent £250,000 in constructing 3½ mi. of trenches within the dock area for the protection of 30,000 workers from blast and splinters in air attack. Rescue, fire prevention and gas decontamination services were also organized, involving much time and attention. Notwithstanding this, the Authority managed to carry on their program of improvements on which

they embarked some three years ago and certain works were completed in the early part of 1939, including two new warehouses for plywood at the Surrey docks. Considerable progress was also made in the modernization of the Royal Victoria dock, a total length of over 3,000 lin.ft. of deep water quays being rendered available, while substantial progress was made in the erection of warehouses. Improved accommodation has also been provided at the India and Millwall docks. As matters of outstanding importance at other British ports, there may be mentioned the new branch dock, roac. in area, at the Royal Edward dock, Avonmouth, which was begun in Feb. 1939 and was (Jan. 1, 1940) well in hand. At Cardiff, a new general cargo quay, 1,000ft. in length, was completed and put into commission. The year 1939 was notable at this port by reason of the commemoration of the centenary of the opening of the first dock—the Bute West dock. At Newcastle, the Tyne Improvement Commission were building, at a cost of £221,000, a new quay in the Tyne dock. At Leith, the construction of new breakwaters for the extension of the harbour was progressing steadily, the Eastern breakwater being nearly completed, while about one-third of the Western breakwater was formed. On the other side of the Irish sea, much progress was made at Dublin with the construction of two new wharves for tankers, and the extension of the Alexandra quay for a length of 1,400ft. was commenced.

France.—In France, the same general considerations obtained as in Great Britain, but certain works of importance were in hand; notably at Dunkirk, where a new entrance lock, 984ft. long, was completed; at Calais, where a new maritime station was inaugurated, and at Marseilles where the reconstruction and extension of the Eastern basins was well advanced.

By a decree dated March 20, 1939, the ports of Havre and Bordeaux ceased to be autonomous in administration.

Holland.—In Holland, a new oil basin, with an area of 35ac., was in course of formation at Pernis, within the port area of Rotterdam, where a new wharf and cargo shed were recently completed.

Denmark.—In Denmark, the new port of Fredericia was opened in July 1939. An important program of improvements was foreshadowed for the port of Copenhagen.

Spain.—Following the devastation produced during the civil war, the National Government in Spain is proceeding with the repair and modernization of a considerable number of Spanish ports, including those in the Balearic isles.

Other notable events in Europe include the inauguration of works for a new harbour at Tashaul in Rumania, as a relief port to Constanta.

Africa.—In Egypt, the harbour of Alexandria is to be improved. At Capetown, the new outer breakwater is practically completed for its full length of 7,000ft., while over 2,000 lin.ft. of quay wall was constructed and a considerable amount of dredging and reclamation work carried out. Four berths for shipping were brought into commission in the new basin, which ultimately will be able to accommodate 17 ocean-going vessels.

Australia.—During the summer of 1939 a contract was placed for the construction of the new Appleton dock adjacent to the Victoria dock at Melbourne. It will provide berthage for six large ships. (B. Cu.)

A NEW FLOOD WALL on the Ohio river completed in 1939 protects the business district of Huntington, West Virginia

Roads and Highways. Throughout the world there was great activity in the first half of 1939 in modernizing old road systems to make them suitable for present traffic and the world network of highways continued to grow and extend into regions formerly inaccessible. Road building came to a sudden stop in most European countries with the beginning of war in September. Highway improvement has made possible a continuation of the phenomenal increase in the use of motor vehicles. At the beginning of 1939, 43,819,929 motor vehicles were in operation, an increase of 1.7% over the previous year and an increase of 36.8% over the preceding 10 years. The United States holds first place in number of vehicles with about 30,000,000 followed by the United Kingdom with 2,611,000, France in third place with 2,251,000, Germany next with 1,816,000, Canada in fifth position with 1,375,000; Australia follows with 758,000. Countries of English speaking people all rank high in number of motor vehicles and mileage of improved highways but excellent highway transportation facilities are now being provided in many countries that were considered backward only a few years ago.

In the older, more densely populated countries with old established highway systems, the greater part of the work done consisted of modernizing main highways to make them suitable for the present speed and volume of traffic. There was also a more definite realization of the need for special motor roads built according to the highest standards to accommodate the large volumes of traffic in metropolitan and congested areas. Highways of this type are not new. There are numerous examples of high-standard multiple-lane highways and Germany has been engaged in

*Information collected by U. S. Department of Commerce.

building a national system of such highways. In the first half of 1939 more highways of this type were being built or planned, and in England, France and the United States there has been general discussion of the necessity of planning and making provision for future needs for heavy-traffic, high-speed arteries. Projects of this type are the ones that attract the greatest public notice

SIX-LANE EXPRESS HIGHWAY from Lincoln tunnel, New York city, opened June 30, 1939

but in nearly every country with an old road system attention has been centred most largely on modernization of the old roads.

Since the beginning of war in Europe in Sept. 1939 very little news concerning highways has been reported. Such information as has become available indicates that major highway work has been stopped in the countries at war. In these countries highways are playing an important part in the movement of troops and supplies, and in the production of munitions, machines and other war materials. Motor vehicles have been conscripted, gasoline is being rationed and it is evident that highway transport facilities are to be devoted entirely to war purposes and supplying the essential needs of civilian populations.

United States.—In the United States more than a billion dollars has been expended annually on highways since 1923 and in each of the last three years between 1½ and 2 billion dollars has been expended.

In the highway program administered by the Public Roads Administration of the Federal Works Agency, largely in co-operation with the States, 13,482mi. of highway were improved in the fiscal year 1939 and 382 highway-railroad crossings were eliminated. The United States leads all other countries in the progress made in elimination of grade crossings.

In April 1939 the Federal Government completed the first comprehensive study ever made of the national highway situation, taking into account conditions on city streets, main rural highways and on secondary or farm-to-market roads. The study revealed that express routes passing directly through the centres of our largest cities are urgently needed to relieve serious traffic congestion. Difficulties of acquisition and the high cost of necessary rights-of-way are the most serious obstacles hindering provision of the needed improvements. The report which was sent to Congress by the President recommended: The construction of a system of interregional highways complete with connections through and around cities; modernization of the Federal-aid highway system; elimination of hazards at railroad grade crossings; improvement of secondary roads; and the creation of a Federal Land Authority to facilitate the acquisition of lands needed for public purposes.

The report states that a system of transcontinental toll is not economically feasible and would not solve any considerable part of the highway problems.

Canada.—Highway development in the provinces of Canada is following closely along the lines of development in areas of the United States with comparable population density. Ontario, the province most advanced in road building, has over 5,000mi. of sur-

facied road. This province has completed a considerable mileage of special "motorways." Vast northern areas of Canada are being opened by roads being constructed in other provinces. Roads now under construction in the Canadian Rockies will make accessible some of the world's outstanding scenic wonders.

Inter-American Highway.—Nearly half of the projected Inter-American highway is now surfaced. This highway, 3,267mi. in length, extends from the United States through Mexico, Guatemala, El Salvador, Honduras, Nicaragua and Costa Rica to Panama. At present 1,123mi. are paved, an additional 669mi. may be traversed at all seasons, 653mi. are usable in dry weather and 822mi. are only trails.

Recent highway construction along the west coast of South America and in Argentina leaves only a few major obstacles in the way of a Pan-American highway linking together all countries of the two American continents.

Mexico continues its rapid progress in the creation of a national highway system. During 1938, 641mi. of highway were constructed of which 435mi. were surfaced.

Argentina.—This country is making excellent progress in carrying on the ambitious highway program initiated in 1933 by the National Highway Bureau. Since then 23,000mi. of road have been improved and in 1937 and 1938 the rate has been at about 620mi. a year. Both a national highway system and secondary or feeder roads are being built. Many miles of low-cost road of types similar to those used in the United States are being built on the secondary system. Specific authorizations of funds have recently been made for improvement of international routes. Transit over the Andes to Chile has been blocked for about seven months of the year on account of snow.

A joint commission of engineers representing the Argentine and Chile has recommended plans to enlarge a railroad tunnel so as to make highway communication between the countries possible for nine months of the year.

Brazil.—The great area of Brazil presents a difficult problem to its road builders. Of the 120,000mi. of road reported, about 20,000mi. have been improved. Brazilian authorities are planning a network of highways connecting State capitals but as yet national funds have been made available only in small amounts. The State of Rio Grande do Sul is particularly active in road work and is planning the construction of about 450mi. of entirely new road.

United Kingdom.—Highways of the United Kingdom are practically all surfaced. Authorities are now engaged in modernizing the old roads, a problem more difficult than in any other country because of the dense population and the many roads located hundreds of years ago that are still in use. During 1939 many major improvements were made both in the London area and adjacent to large cities throughout the Kingdom. When the outbreak of war put an end to major highway activity the Ministry of Transport had begun rebuilding the Great North road from London to Edinburgh as a fine modern road designed according to the latest standards and departing from the Roman road in many places. It was planned to spend £2,000,000 on 26 projects, 14 of which had been started.

Europe.—Every European country made substantial progress in road development during the first eight months of 1939. The war-torn roads of Spain were being repaired and it was planned to spend \$92,000,000 for work already begun and \$245,000,000 for supplementary work. The supplementary work will include 388mi. of new national highway, 1,242mi. of regional highway, and 6,213mi. of local road.

Germany continued the rapid improvement of the system of Reichsautobahnen begun in 1933. Work was pushed on both the original system and on extensions into territory brought under German control. These highways

have broad surfaces with separated traffic lanes, widely spaced entrances, controlled roadsides, and separated grades at crossings and are designed throughout for large volumes of fast-moving traffic. On July 1, 1939, 3,077km. had been completed, an increase of 713km. over the preceding year, and 2,095km. were under construction.

In the summer of 1939 Sweden was planning the immediate construction of its first express highway from Stockholm to Göteborg. At the same time Poland was engaged in surfacing 1,600km. of highway. This country had only one paved road to its borders, a road from Warsaw to the German boundary near Katowice. Since 1922 Italy has improved about 1,500km. of entirely new State roads and 150km. are now under construction or planned for immediate construction. An intensive program of road construction was begun in Albania immediately after the Italian occupation. More than 10,000 workers are reconditioning old Roman roads and building new roads.

France has an excellent system of highways as a result of more than a century of competent technical direction. In the past year work has been done in modernizing portions of the system, particularly in the region of Paris.

The projected highway from eastern Europe to Istanbul, Turkey, approaches nearer to completion each year. Travel has been possible from France, Germany and Belgium to near the border of Yugoslavia and almost the entire route through Yugoslavia has been improved. Much work has been done in Bulgaria and it is reported that the 256km. section in Turkey from the Bulgarian border to Istanbul will be completed in 1940.

Africa.—Some road building has been done in every country of Africa and this continent is no longer one with an interior that can be reached only over trails. It is now possible to travel by automobile from the Mediterranean through French, Belgian and English territory to Cape Town. Some sections of the road are rough and the route is to be recommended only to experienced travellers. The outstanding highway work in Africa is being done by the Italian Government in Abyssinia and by the Union of South Africa. Important centres in Abyssinia, Eritrea and Italian Somaliland are being connected by a system of nine main roads. In little more than two years 2,100mi. of surfaced roads have been built.

The cost of transporting goods 780mi. from Massawa to Addis Ababa is only one-fifth of what it was in 1936. The Union of South Africa made good progress in the fourth year of its program of constructing 5,400mi. of surfaced road. Since the beginning of war in Europe work has been speeded up on certain of the national roads as a defence measure.

Australia.—For several years road work in Australia has gone forward as a continuing program directed by State authorities. In 1937 a policy of Federal aid to the States was initiated, supported by funds derived from imposts on imported gasoline and that refined in Australia.

Roads connecting the principal cities have already been completed and feeder roads are being extended into the less thickly settled sections.

China.—Before the beginning of the present conflict in China that country was outstanding in its effort to overcome lack of communication through construction of highways. While there has been great destruction of highways in eastern China as a result of military operations, road construction has progressed rapidly in western China. Highways have been built to French Indo-China, Burma and the Soviet Union to establish communications from which China was cut off by Japan's occupation of its ports. Chinese authorities report that construction has been at a rate of 20mi. a day during the past two years. The present war-time capital is rapidly being connected by highway with all provinces under Chinese control. An outstanding achievement is the construction of the Yunnan-Burma highway, about 610mi. in length. Additional work is yet to be done but the

THE "TRAFFICSCOPE," a combination of prisms which gives a motorist unobstructed vision of the other side of a hill, was first tested in 1939 near Harrisburg, Pennsylvania

highway is already in use and a bus line has been established on it.

Robinson-Patman Act: see CHAIN STORES.

Rockefeller Foundation was chartered in 1913 for the permanent purpose of "promoting the well-being of mankind throughout the world." Its present program is concerned with certain definite problems in medical, natural, and social sciences, the humanities, and public health. In the field of medicine its interest is centred in nervous and mental diseases, and its contributions are chiefly for the furtherance of research and teaching in psychiatry and allied subjects. Its program in the natural sciences is concerned with experimental biology. In the social sciences it has three spheres of special interest: international relations, social security, and public administration. The program in the humanities centres around the techniques by which cultural levels of contemporary society are being influenced—such as museums, the radio, drama, and libraries—and the promotion of better international understanding through cultural interchanges. The program in public health includes research on a number of selected diseases; demonstrations in the control of some of these diseases in their environments; co-operation with Governments in services of central or local health departments; and the development of public health education. During 1939 the Foundation appropriated approximately \$9,400,000 for work in its various fields of interest. The chairman of the board of trustees is John D. Rockefeller, Jr.; the president, Raymond B. Fosdick; and the secretary, Norma S. Thompson.

General Education Board was incorporated by an act of Congress in 1903, with the stated object of "promoting education within the United States of America without distinction of race, sex, or creed." Its present program is restricted largely to three types of work: (1) the support of research and experimentation in relation to the problems presented in the field of general education, i.e., the secondary school through the junior college level; (2) the continuance of the existing program in the Southern States; and (3) a program, now coming to a close, in child growth and development. During the year 1939 appropriations approximating \$3,814,000 were made by the board. The chairman of the board of trustees is Ernest M. Hopkins; the president, Raymond B. Fosdick; and the secretary, William W. Brierley.

(H. B. V. W.)

Rogers, James Harvey (1886–1939), U.S. economist, was born at Society Hill, S.C. on September 25 and was educated at the University of South Carolina and at Yale, where he received his doctor's degree in 1916. In the meantime he had pursued graduate study for a year at the University of Geneva in Switzerland. From 1916 to 1920 and from 1923 to 1930 he taught economics at the University of Missouri; he also taught for three years at Cornell university and in 1930 he joined the faculty of Yale university as professor of political economy. He was acknowledged by this time to be one of the nation's leading economists. Not long after 1929 he advocated inflation as an economic remedy, and in *America Weighs Her Gold* (1931) he pointed out the disadvantages of a blind adherence to the gold standard. In 1933 he became one of the original members of President Roosevelt's "brain trust" and with Prof. George F. Warren outlined the monetary program which led to devaluation of the dollar in Jan. 1934.

He was killed August 13 with 13 others when a "baby clipper" plane plunged into the harbour at Rio de Janeiro.

Roman Catholic Church. Sorrow spread through the universal church when the 82-year-old pontiff, Pius XI, died on February 10, 1939. At the call of the papal chamberlain, Eugenio Cardinal Pacelli, secretary of State, 62 cardinal electors assembled in the Vatican. The Conclave solemnly opened on March 1. On the next day, after the third ballot, Cardinal Pacelli was proclaimed sovereign pontiff. He took the name of Pius XII and was solemnly crowned on March 12. He became the 261st successor of St. Peter as vicar of Christ on earth.

Population.—It is estimated that one out of every seven persons in the world is a Catholic. Exact figures are not available, but it is known that the Catholic world population is in excess of 375,475,000. The largest proportion is located in continental Europe.

In the English-speaking lands, the United States leads according to revised figures of the Official Catholic Directory with 21,406,507, an increase of 239,827 over 1938. Latest estimates place the number of Catholics: in England and Wales at 2,406,419, an increase of 31,223; in Scotland, at 614,449; in Ireland, at 3,013,701; in Canada, at 4,771,000; in Australia, at 1,258,112; in New Zealand, at 193,725.

Roman Curia.—Pius XII selected Luigi Cardinal Maglione as his secretary of State. In December, he named Lorenzo Cardinal Lauri as papal chamberlain. Through the year, he strengthened ecclesiastical procedure by several other notable appointments.

The government of the universal church is centralized at the Vatican. Twelve Sacred Congregations, presided over by cardinals, have executive and legislative powers; three Tribunals exercise judicial functions; five Offices transact the ordinary business. The reports and decisions of these Congregations and Tribunals are published in the *Acta Apostolicae Sedis*.

Outside of the activities of the secretariat of State, treated later under *Spiritual and Temporal Relations*, popular interest attaches each year to the decisions of the Tribunal of the Sacred Rota. According to the latest report, 97 cases were presented to the judges; of these, 65 were matrimonial. The decree of nullity was pronounced on 19, the marriage was held to be valid in 46 cases. Twenty-five petitions sought annulment because of lack of consent; only three decrees of nullity were granted for this reason. Of general interest, likewise, are the decisions of the Congregation of the Holy Office in regard to the Index of Forbidden Books. Three titles were added during the year: d'Annunzio's *Solus ad Solam*, and Ubaldi's *L'Acesi Mistica* and *La Grande Sintesi*.

A notable decree was issued by the Sacred Penitentiary on July 22, to the effect that a plenary indulgence may be imparted over the radio.

Ecclesiastical Jurisdictions.—The number of cardinals, traditionally held at 70, declined from 62 to 57 by the end of 1939. Cardinal Pacelli was elected pope, and death visited Cardinals Sbaretta, Mariani, Dolci and Mundelein. No new cardinals were created.

Throughout the world the church is divided into 1,702 jurisdictions. These are classified as 14 patriarchates, 255 archdioceses, 937 dioceses, 292 vicariates apostolic, 135 prefectures apostolic, 50 abbasies and 19 mission prelaties.

Two jurisdictions were erected in the United States. The area comprising the District of Columbia, formerly a part of the archdiocese of Baltimore, Md., was designated as the archdiocese of Washington. Though holding rank as an archdiocese, it will be governed by the archbishop of Baltimore. Gallup, N.M., was constituted a diocese, thus raising the total of American Sees to 117. Two of these, Boston, Mass., and Philadelphia, Pa., are governed, respectively, by Cardinals O'Connell and Dougherty.

Among the notable appointments of the year were: Most Rev. Francis J. Spellman as archbishop of New York, N.Y., and bishop ordinary for the army and navy; Most Rev. Samuel A. Stritch, in succession to Cardinal Mundelein, as archbishop of Chicago, Ill.; Most Rev. Moses E. Kiley, as archbishop of Milwaukee, Wis.; Most Rev. Joseph Schrembs, bishop of Cleveland, O., was given the rank of archbishop; Most Rev. Edwin V. O'Hara was transferred from Great Falls, Mont., to Kansas City, Mo.; Most Rev. William O. Brady was consecrated bishop of Sioux Falls, S.Dak.; Most Rev. William J. Condon, of Great Falls, Montana.

In England and Wales, there are four archbishoprics, of which Westminster is cardinalitial, and 14 bishoprics. In Scotland, two archbishoprics and four bishoprics. Ireland has four archdioceses, including the cardinalitial see of Armagh, and 25 dioceses. Canada numbers 12 archdioceses, with Quebec cardinalitial, 29 dioceses, 7 vicariates. Australia is divided into 5 archdioceses, 17 dioceses, 1 vicariate, 1 abbacy; and New Zealand into 1 archdiocese, 3 dioceses.

Spiritual and Temporal Relations.—The Holy See, in the person of the sovereign pontiff, holds spiritual power over all the Faithful throughout the world, but also exercises temporal power over the Vatican City State (*q.v.*). In this dual capacity, he exchanges diplomatic representatives with governments and peoples. Thirty-nine nuncios, enjoying full diplomatic rank, are accredited to as many nations. Twenty-three apostolic delegates, having no formal, diplomatic status in the country to which they are commissioned, act as papal representatives. Accredited to the Holy See from recognized governments are 13 ambassadors and 27 ministers and envoys extraordinary. During the year a nuncio was named for Lithuania, the first since 1932. Uruguay exchanged representatives, the first time since 1898. In December, without resuming diplomatic relations which lapsed in 1867, President Roosevelt named Myron C. Taylor as his special representative to Pope Pius XII.

All the spiritual and moral influence of the Holy See was directed toward the preservation of peace before September, and since then, for its return. Pius XII seized every opportunity of a public nature to issue appeals. Through diplomatic channels, he attempted, without success, to promote conferences between the governments, excepting Soviet Russia, engaged in war overtures. In these efforts, the pope stated he would not involve the Holy See in political or territorial controversies.

Pope Pius XII welcomed President Roosevelt's proposal for parallel efforts, and issued a five-point program for adjusting European problems.

The church flourished in the United States, and the gains in membership more than compensated for the losses. The 150th anniversary of the establishment of the American hierarchy was observed. In this connection, under date of November 1, Pius XII issued an encyclical, *Sertum laetitiae* addressed to the American bishops.

In France, Great Britain and the countries of the British Commonwealth, there were new and happy auguries of peaceful relations with Catholicism and the Holy See. The church authorities supported the Governments to the fullest extent in the prosecution of their war aims.

Special regulations and exemptions of a disciplinary nature were put into force.

Accord between the Holy See and Italy was further strengthened. The waning influence of Nazi Germany and a pronounced opposition to Communism brought Italy closer to the spiritual aims of the papacy, as did the parallel efforts made to preserve peace. Further agreements on the Concordat were published in June. The Nationalist Government in Spain solidified its loyalty to the church. Some disagreements were inevitable during the

reconstruction period, as to the relation of the church and State, but these were reliably reported as being adjusted amicably.

Condemnation of the destruction of Poland and deep sympathy for the Polish people subjected to atheistic Sovietism and Nazi paganism, were frequently expressed by the Holy See. On October 7, the Vatican recognized the Polish Government set up in Paris.

In Germany, the struggle between Catholicism and Nazi totalitarianism continued. The drive against Catholic education was intensified. Personal attacks on ministers of religion and on Religious were frequent. Conferences between representatives of Nazi Germany and the Holy See were spoken of in the spring, but later developments nullified any accord.

Catholicism, as all forms of religion, was combatted throughout the Soviets. The godless organizations and propaganda increased in intensity. The Holy See recognized, on many occasions, Communism as the greatest menace to religion and world peace. Some new manifestations of Marxian atheism were observed in Mexico, especially in the school decrees.

Missions.—The European war adversely affected the missionary labours through the reduction of the number of missionaries and the curtailing of funds. The number of Catholics in recognized mission lands increased from 14,330,000 to 21,143,000 in the past ten years. Foreign priests number 10,285; native priests, 6,225; religious brothers, foreign and native, total nearly 7,000; religious sisters, almost equally divided between foreign and native, approximate 36,000. Native bishops or vicars govern 44 ecclesiastical territories. It is estimated that 1,439 periodicals support mission activities; of these, 750 are published in mission countries. (See also VATICAN CITY STATE.) (F. X. T.)

Rome-Berlin Axis: see EUROPEAN WAR; GERMANY; ITALY; STRATEGY OF THE EUROPEAN WAR.

Roosevelt, Franklin Delano (1882–). (See *Encyclopaedia Britannica*, vol. 19, p. 535, for an extended biography.) On Jan. 4, 1939, in his annual message to Congress, President Roosevelt stressed the need for stronger national defence and declared that there are many methods "short of war, but stronger and more effective than mere words, of bringing home to aggressor governments the aggregate sentiments of our own people." He observed further that "the probability of attack is mightily decreased by the assurance of an ever-ready defence." In his budget message on January 5, he revealed that the Federal Government faced a deficit of over \$3,300,000,000 for the fiscal year 1940. On January 2, he appointed Frank Murphy attorney-general, and three days later nominated Felix Frankfurter as an associate justice of the Supreme Court. At the Jackson Day dinner in Washington on January 7, he urged that the Democratic Party continue to follow liberal policies.

In a special national defence message on January 12, the President said that "careful examination of the most imperative present needs leads me to recommend the appropriation, with as great speed as possible, of approximately \$525,000,000, of which sum approximately \$210,000,000 would be actually spent before the end of the fiscal year ending June 30, 1940." He proposed that \$450,000,000 be allocated for new needs of the army, \$65,000,000 for new needs of the navy, and \$10,000,000 to train civilian air pilots. He also asked for a \$27,000,000 appropriation to increase the permanent garrison at the Panama Canal Zone, and provide additional housing there. On January 16, he proposed a liberalization of the Social Security Act and three days later recommended legislation to subject the salaries of public employees and income from future issues of public securities to Federal income taxation. On January 20, in letters to Speaker Bankhead and Vice-President Garner, he asked continuation until Jan. 15, 1941, of the \$2,000,-

000,000 stabilization fund, and the power of the Chief Executive to alter the gold content of the dollar.

On March 4, the President addressed a joint session to commemorate the 150th anniversary of the first meeting of Congress, and on March 20, nominated William O. Douglas associate justice of the Supreme Court. On April 14, he made two addresses—one, a Pan American Day address before the governing board of the Pan American Union, the other, at Mount Vernon on the occasion of the 150th anniversary of the message received by George Washington from the first Congress of the United States.

In a letter to the Young Democratic Clubs of America on April 19, he declared that in the campaign "we are now approaching, there is just one agency potent enough to defeat the Democratic Party, and that is the Democratic Party itself." He warned that the Democratic Party "can commit suicide by abandonment of the policies that brought it to power." On April 27, he asked Congress to appropriate \$1,477,000,000 for Federal relief for 1940.

In a statement on March 28, the President advanced a plan for disposing of a substantial part of the 11,000,000 bales of surplus cotton held by the Government. He proposed that \$1.25 a bale be paid to producers who release their loan cotton to the market and that a moderate payment be made on all cotton exported after the plan went into operation. He estimated that the plan would cost from \$75,000,000 to \$105,000,000 during the next 16 months. In a speech before the Retailers National Forum on May 27, he defended Government spending.

On June 8, the President and Mrs. Roosevelt gave a State dinner at the White House to King George VI and Queen Elizabeth.

To stimulate industry and increase employment, the President in a letter to Senator James E. Byrnes of South Carolina on June 21 proposed a new Federal lending program. The plan called for \$3,060,000,000 of self-liquidating loans by Federal agencies over periods ranging from two to seven years. "All can be financed through the issue of guaranteed securities by the government agencies, with good prospect of repayment of both principal and interest through earnings," he said. Of the total, he estimated that \$870,000,000 could be put to work to provide employment for men and machines in various lines of industry during 1940. The Senate approved a "Works Financing Act," but the House refused to consider it before Congress adjourned, Aug. 5.

Though problems of recovery and domestic questions required much of his time, the President, as the year advanced, devoted increasing attention to international affairs. On April 15, he sent cablegrams to Chancellor Adolf Hitler of Germany and Premier Benito Mussolini of Italy, asking assurances from each that their armed forces would not attack or invade their neutral independent neighbours. Provided such assurances were given, the United States would be willing, the President revealed, to enter an international conference to discuss limitation of armaments and international trade problems. "We recognize complex world problems which affect all humanity, but we know that study and discussion of them must be held in an atmosphere of peace," he said. "Such an atmosphere of peace cannot exist if negotiations are overshadowed by the threat of force or by the fear of war."

Despite strong pressure by the Administration, Congress at the first session refused to revise the Neutrality Act by lifting the automatic arms embargo. On July 11 the Senate foreign relations committee, 12 to 11, voted to defer consideration of all neutrality legislation until the next session. The House previously had passed the Bloom bill, embodying some of the Administration's proposals, but retaining a mandatory embargo on exports of arms and ammunition to belligerent States. Though the President urged the advisability of prompt action "in the light of present world conditions," a White House conference of Senate Democratic and Republican leaders agreed to postpone further action, and make

neutrality the first order of business at the next session. In the event of a European war, the President announced that he would immediately call Congress into extra session, in advance of the regular meeting date in 1940.

On August 24, President Roosevelt made an appeal for world peace in messages to Chancellor Hitler, President Moscicki of Poland and King Victor Emmanuel of Italy, and the following day he addressed another peace appeal to Chancellor Hitler. On September 1, he asked the Governments of Great Britain, France, Italy, Germany and Poland to refrain from bombing civilians in the event of war. On September 5, following the declarations of war by Great Britain and France, the President issued two neutrality proclamations, and three days later proclaimed a "limited" state of emergency and ordered increases in the Army, Navy and Marine Corps.

On September 13, he called Congress into extra session to revise the Neutrality Act, fixing September 21 as the date for its convening. Addressing Congress in person, he advocated repeal of the arms embargo and a return to the principles of international law as the best means of preventing involvement of the United States in the European war. After extended debate, Congress repealed the arms embargo and adjourned on November 3, taking action which represented a major victory for the President.

Following the adjournment of Congress, President Roosevelt visited Hyde Park, N.Y., and spent Thanksgiving at Warm Springs, Georgia. On December 1, in a sharply worded statement, he condemned Russia's invasion of Finland and the following day proclaimed a "moral embargo" upon the sale to Russia of United States planes and equipment that might be used in bombing civilians.

On December 23, he dispatched a peace message to Pope Pius XII and announced the appointment of Myron C. Taylor as his personal representative and "peace ambassador" to the Vatican. In his message to the pope, the President referred to the parallel efforts in Rome and Washington to aid in bringing back a just peace.

The President spent Christmas Day at a family gathering at the White House. During the closing days of December, he devoted most of his time to conferences with congressional leaders and to work on his budget and annual messages. (See also UNITED STATES.) (O. McK.)

Rosenwald Fund, The Julius. The Rosenwald Fund differs from other large American foundations in that the trustees are not only permitted to spend capital as well as income at any time but are compelled to expend all its funds within 25 years of the death of its founder, that is, before Jan. 6, 1957. During the 22 years since its establishment in 1917 by Julius Rosenwald, this fund has expended more than fifteen million dollars (\$15,335,534), being all of its income from year to year and about three-fourths of its principal fund. At the close of the past fiscal year, June 30, 1939, the assets of the fund (held chiefly in capital stock of Sears, Roebuck & Co. of Chicago) had a value of approximately \$5,000,000.

The chief program of the fund during its early years was aid in the building of rural public schools for Negroes. The main programs at present are (1) improving the content and quality of rural education in both white and Negro schools in the South; (2) aid in building up four important centres of higher education for Negroes: Howard university in Washington, D.C., Atlanta university in Atlanta, Georgia, Fisk university in Nashville, Tennessee, and Dillard university in New Orleans; (3) efforts in behalf of Negro health; and (4) a series of fellowships for Negroes and for white Southerners.

During the year 1939 the fund expended \$530,202 upon these and related programs.

Ross, James Delmage (1871-1939), U.S. civil engineer, was born November 9 at Chatham, Ont., Canada. In 1903 he was appointed superintendent of the municipal power system in Seattle, Washington. From this position he obtained a leave of absence in 1933 to become advisory engineer on power with the Public Works Administration in Washington. In 1937, Pres. Roosevelt appointed him administrator of the huge Bonneville dam project on the Columbia river. Upon his death at Rochester, Minn., March 14, Pres. Roosevelt paid tribute to him as "one of the greatest Americans of our generation."

Ross, John Dawson (1853-1939), U.S. librarian and authority on Robert Burns, was born at Edinburgh, Scotland on October 23 and was educated at the School of Arts there. He removed to the United States in 1873. In 1894 he organized a book company in New York city and was its manager until 1910. He joined the staff of the New York Public Library in 1920. Ross was the author of many books on the Scotch poet, including *Burnsiana* (1892), *The Memory of Burns* (1899), *The Burns Handbook* (1930), and *The Love Songs of Robert Burns* (1932); also other volumes on Scotch poetry and songs. He died at New York city October 29.

Rowing. The 1939 intercollegiate rowing season opened in the U.S. on April 15 with two regattas. On the Oakland estuary the University of California varsity scored a decisive victory over their ancient rivals from the University of Washington, for the first time since 1932. Losing also to California in the junior varsity event Washington found some solace in the easy victory of their promising freshman crew. On the Harlem river Columbia easily defeated crews from Rutgers and Manhattan.

Harvard easily defeated Rutgers, Massachusetts Institute of Technology (M.I.T.) and Boston university April 22 on the Charles river, making a clean sweep in varsity, junior varsity, freshman and lightweight events. The Naval Academy crews opened their season the same day by defeating Princeton on the Severn river in varsity and junior varsity events but only after close hard races, winning each by about a length.

Navy won a second time on April 29 by defeating Columbia at Annapolis, Md., and were deprived of a clean sweep by the victory of the Columbia freshmen. Having won the mythical intercollegiate championship at Poughkeepsie in 1938 the Navy thus continued their winning streak and loomed as another potential champion. At Ithaca, N.Y., Cornell opened its season by defeating a powerful Syracuse varsity by less than a second in a close and exciting race, M.I.T. trailing by many lengths. A third regatta on this day found Pennsylvania also making its rowing debut on the Schuylkill, winning rather easily over crews from Rutgers and Manhattan.

The eastern rowing season swung into full stride on May 6 with three major regattas. On the Housatonic, Yale in its first trial of the season defeated Pennsylvania and Columbia in the historic Blackwell Cup regatta winning by 1½ lengths and breaking the course record held by Columbia since 1929. On the Severn river Cornell substantiated the promise it had shown the previous Saturday and defeated the powerful Navy crew, removing them from the undefeated class. The margin of victory was about 1½ lengths and although the Navy offered stiff resistance there was no doubt but that Cornell was a really fine crew. On the Charles river Harvard scored a clean sweep in varsity, junior varsity, freshman and lightweight events rowing against Syracuse, Princeton and M.I.T. This was the ninth consecutive victory for the Harvard varsity over a period of two years.

Yale scored a clean sweep over varsity, junior varsity and freshman crews of Syracuse and M.I.T. on the Housatonic river May

IN RECORD TIME, a University of California crew defeated the University of Washington by more than six lengths in their annual regatta Apr. 15, 1939, in Oakland estuary

13. A close varsity race was turned into a walk-away for Yale when an unfortunate mix-up with one of the lane markers forced Syracuse out of the race after rowing nearly even with Yale for a mile. On the same day Princeton also scored a clean sweep over Columbia and Pennsylvania in varsity, junior varsity and freshman races.

The Carnegie Cup regatta at Princeton on May 20 saw Cornell triumph in junior varsity and freshman races in easy fashion over Yale and Princeton. Yale for the second time in 1939 broke a course record, and finished its short distance season undefeated. Keeping its two-year victory record intact Harvard scored its tenth consecutive win, this time at the expense of Navy, Pennsylvania and Columbia on the Charles river.

A fitting climax to the eastern short distance season was scheduled for May 27 on the waters of Lake Cayuga at Ithaca. The undefeated Harvard crew was pitted against Cornell, Pennsylvania and Syracuse. Before the races could be run off a blinding hail and wind storm swept the waters of the lake into a fury. Regardless of the hazardous conditions the races were held and Cornell with a remarkable exhibition of watermanship defeated Harvard by a length with Syracuse and Pennsylvania close behind.

The University of Wisconsin varsity crew, enroute to the Poughkeepsie races, stopped at Lake Onondaga and raced Syracuse on June 9 over a three-mile course, losing by one and one-half lengths.

Seven varsity crews lined up at the start of the annual Poughkeepsie four-mile race in the evening of June 17. The usual rivalry between eastern and western rowing had shown an equal sharing of honours in the two preliminary races.

California won in the record time of 18:12 $\frac{3}{4}$; Washington was second, also breaking the old record (18:19) for the 4-mile course set by Navy in 1938.

The blistering pace set by the powerful western crews over the

last two miles caused the eastern contingent to drop several lengths back, led by Navy with Cornell, Syracuse, Wisconsin and Columbia finishing in the order named.

The college rowing season was brought to a close by the 77th annual Yale-Harvard regatta on the Thames river June 23. Starting at Bartlett's Cove the undefeated but inexperienced Yale crew faced the veteran and powerful Harvard eight and soon after the start Harvard pulled into a slight lead. Rowing at a lower stroke they gradually lengthened their advantage to a maximum of over two lengths at the two-and-a-half-mile mark. Here Yale seemed to improve and soon after the three-mile flags were passed began closing the gap between the two shells. Over the last mile the splendid Harvard crew although being overtaken by Yale was able to hold its lead and crossed the finish line at New London slightly more than a length ahead of Yale and thus completed a clean sweep of the regatta, having won the freshman and junior varsity races in the morning.

Harvard won the annual Joseph Wright Cup race at Cambridge for the championship in the lightweight division of college rowing. Tabor academy was the undisputed champion of preparatory school rowing being undefeated in five races. (E. O. LE.)

Great Britain.—Contrary to all expectations, Cambridge won the University boat race early in April during 1939. Facing an Oxford crew which had been considered much too strong for them, the somewhat lighter Cambridge eight confounded the critics and their opponents by starting with a tremendous rush which gave them a lead of almost a full boat length at the end of the first half-mile and open water at the end of the first mile. Oxford, completely surprised by the unexpected starting speed of the others, never was able to settle to real rowing, struggled hard but was never back in the race. Cambridge, with a comfortable lead, dropped its stroke to 30 and paddled over the course in control all the way. At one point, the winners had almost six lengths of lead, holding four at the finish in face of a late rally by the losers.

The Henley regatta was notable for the dominance of foreign crews. Harvard university won a victory in the Grand Challenge Cup, becoming the second United States, and incidentally Harvard, crew to win this event, the last time in 1914. Turning back London Rowing Club, holders of the Grand, in their first heat, Harvard continued to win all its heats without much trouble, defeating the Argonaut Rowing Club of Canada in the final. The final was rowed into a squally headwind, Harvard winning by 3 lengths in 7:40.

The Diamond Sculls were won once more by Joe Burk of the United States, his unorthodox, straight up stroke and high rate giving him his second successive victory in this, R. Verey of Poland being the runner-up. The winner had $1\frac{1}{4}$ lengths at the finish and his time was 9:15. The Thames Challenge Cup, which has been taken frequently in the past by United States schoolboy crews, produced an All United States final when Tabor academy defeated Kent school, the latter the holders. The Zurich Rowing Club won the Stewards Challenge for Fours, Trinity hall of Cambridge took the Visitors Cup for Fours; the Ladies Challenge Plate went to Clare college of Cambridge; the Maidenhead Rowing Club, by taking the Wyfold, contributed a British victory and John Beresford, Jr., and L. F. Smithwood, coming from behind to tie J. Scherlie and Brothie of the Trieste Rowing Club, furnished another British first place in the finals. (R. F. K.)

Rubber and Rubber Manufacture.

Although progress was made in 1939, as in former years, in improving the quality of certain materials used with rubber, no outstanding new commercial development appeared either in materials or in methods of processing and manufacturing rubber goods. Nor were there any startling announcements of new rubber-like synthetic materials which rubber manufacturers might use as an adjunct to their operations with natural rubber. The use of imported Perbunan increased rapidly up to the onset of the European war, when the supply was abruptly stopped. Active progress is being made to synthesize similar materials in the United States. Because of cheaper raw materials and elimination of import duties, development of uses for the American-made product should be stimulated. The use of other rubber-like materials, notably Pliofilm and Koroseal, likewise increased greatly during 1939. Koroseal-insulated building wire for low-voltage circuits, recently announced, is less bulky than the earlier type of conductor sheathed with rubber and braided textile covers. Consequently, larger conductors or more circuits may now be installed in any conduit. This new product not only offers economy in new lighting installations but permits increase in total lighting load on conductors newly installed in old conduits.

Marked progress was made in extending the uses of articles developed in former years. Sponge rubber from latex found greatly increased application in seat cushions and mattresses. It was adopted for automobile seat cushions, and railroads were stimulated to adopt it because of the superior comfort obtained through its use in intercity buses. Conveyor belts combining great strength and flexibility were installed for handling coal underground where space for transport is limited. V-belts, long used for power drives for various types of stationary machines, were increasingly applied on agricultural machinery, particularly on small combines.

These belts, specially designed to withstand shocks caused by

stones or lumps of earth accidentally passing through the machine, have aided greatly in reducing the cost of combined harvester and thresher to a point within the means of the average farmer. Rubber tires, also, have been an important factor in this direction. Increasing numbers of farm implement machines and farm tractors were equipped with rubber tires. During 1939 more than half the farm tractors manufactured were so fitted.

Applications of rubber for reduction of noise and vibration were extended. Wheels for rail-vehicles were constructed so as to support the load of the cars on rubber in shear and to reduce the shocks to rails and to car bodies and greatly diminish noise. Under rails, mainly on bridges and in terminals, tie plates with rubber inserts have been installed. These carry the full weight of rails and cars and successfully decrease noise and vibration. Moreover, plastic rubber sprayed on metal has been found effective in reducing noise inside automobiles and aeroplanes.

The use of rayon cords as reinforcement in high speed tires increased greatly during 1939. Sales of large tires for earth-moving or strip-mining operations were markedly enlarged. Scrapers for stripping earth from the surface require enormous tires, some weighing 750 lb. and capable of carrying a 20,000-lb. load. As aeroplane travel has increased and larger planes have appeared, the predominant sizes of aeroplane tires have shifted to larger dimensions. Puncture-sealing tubes found increased acceptance and the European war developed a need for similar tubes to hold air after bullets have punctured them.

Both rubber and synthetic materials were increasingly utilized for equipment to hold corrosive solutions. Plating baths from which bright nickel is deposited are sensitive to minute quantities of impurities; but rubber linings were designed which serve admirably in this exacting service. Metal tanks were lined with Koroseal to resist the action of nitric acid used for cleaning articles of stainless steel, copper, brass or nickel. Similar containers were supplied for resisting the intensely corrosive action of chromic acid baths for chromium-plating operations.

A number of miscellaneous applications of rubber are of interest. Rubber strips were applied extensively for sealing of joints in roads. These seals are designed to remain below the road surface at all times and effectively exclude water. Hard rubber possessing special electrical properties and moisture resistance was adopted for insulation in radio equipment. Special rubber facing for materials used in filling tree cavities was supplied. Growth of new bark over this rubber was found to be more rapid than over any other material heretofore tried. Rubber insulators for holding telegraph wires on poles were adopted to guard against malicious breakage, and found to permit less surface leakage of electricity than those they replaced. (J. W. Sc.)

Rugby: see FOOTBALL: *Great Britain*.

Rulers: see SOVEREIGNS, PRESIDENTS AND RULERS.

Rumania. Area 113,919 sq.mi.; pop. (est. Dec. 31, 1938) 19,852,000 (Rumanians 75%; Magyars 8%; Germans 4%). Chief towns (pop. est. July 1, 1938): Bucharest and suburbs (cap., 646,744); Chisinau (112,941); Cernauti (109,821); Iassy (104,597); Galati (102,235); Cluj (100,099). Ruler King Carol II; premier, M. Tatarescu; language, Rumanian; religion, Christian [Greek-orthodox 13,108,227; Greek-Catholic 1,427,391; Roman Catholic 1,234,151 (census figures 1930)].

History.—On February 1, the cabinet resigned. A new Government was constituted with the Patriarch, Miron Cristea, again premier, M. Calinescu vice-president of the council and minister of the interior and of national defence, and M. Gafencu foreign minister. On March 6 the Patriarch died and M. Calinescu be-

came premier. Parliamentary elections were held on June 1 and 2, only candidates for the National Front being allowed to stand; parliament was opened on June 7.

There were several clashes with the Iron Guard in the spring, but policy towards Jews and national minorities (most of which joined the "National Front") was more conciliatory. M. Gafencu remained in close touch with his fellow-statesmen of the Balkan Entente, and also with Poland; but relations with Hungary became severely strained at the Czecho-Slovak crisis of March; troops were called up and remained on the frontier during the summer. When in August M. Gafencu offered Hungary a non-aggression pact, Count Csáky insisted on receiving at least formal guarantees for the Magyar minority as a preliminary.

On March 17 it was reported that a German economic mission in Bucharest had proposed to Rumania a far-reaching agreement whereby Rumania was assured a market for her agricultural surplus in return for her reducing her industries. German experts were to co-operate on favourable terms in developing certain of Rumania's natural resources. The trade agreement actually concluded on March 23 was much less unusual, although Germany was promised a large share in developing Rumania's mines, forestry, oil wells, etc. and undertook to supply arms and munitions extensively. But subsequent trade agreements with France (March 31) and Britain (May 11) somewhat restored the balance. The British and French guarantees to Rumania (April 11) were received "with satisfaction."

On September 6, following the invasion of Poland, Rumania decided to maintain strict neutrality, although the German and subsequent Soviet advance, which wiped out of existence her chief ally, made her position very difficult. She showed an increasing tendency to lean on Turkey, with whose help she hoped to weld the Balkans into a "neutral bloc"; but although her neighbours likewise proclaimed neutrality and disclaimed aggressive inten-

UNENVIABLE POSITION of Rumania after the Nazi-Soviet partition of Poland Sept. 29, 1939, as viewed by Elderman in *The Washington Post*

FUNERAL OF RUMANIAN PREMIER Armand Calinescu, assassinated Sept. 21, 1939, in Bucharest by members of the Fascist Iron Guard

tions, Hungary even withdrawing her troops from the frontier, both Hungary and Bulgaria were unwilling to join any bloc, instead reviving, ever more openly, their claims on Transylvania and Dobruja respectively. In face of these, Rumania declared repeatedly that she would make no territorial concessions.

Meanwhile, M. Calinescu was assassinated on September 21 by a member of the Iron Guard. M. Argeșeanu became premier, being succeeded on September 28 by M. Argetoianu. On November 22, following trade talks with Germany, which was reported to have demanded a more favourable rate for the mark against the leu, the minister for national economy resigned, the whole cabinet resigning next day. On November 24 M. Tatarescu, the former liberal leader, formed a new cabinet which seemed less remote from the old party alignments although M. Gafencu continued as foreign minister. His first task was to give a sharp reply, defending the justice of Rumania's frontiers, to the equally strong comments which Count Csáky had made in his speech on Hungarian foreign policy on November 21. Relations with Bulgaria remained little more satisfactory, and uneasiness was caused by an article in the *Communist International* of Moscow suggesting that the U.S.S.R. proposed to turn their attention to Rumania when they had finished with Finland.

On December 22 Rumania signed a further trade agreement with Germany fixing the rate of the leu to the mark at the lower value of 49.50, providing for an increased export of Rumanian oil to Germany of 130,000 tons monthly, and guaranteeing to Rumania certain deliveries of armaments from the Skoda works.

Education 1937.—Elementary, State schools 15,630; scholars 2,338,851; secondary, all schools 913; scholars 190,272; universities 6; registered students 34,093.

Banking and Finance.—Revenue, ordinary (est. 1939-40) 39,933,000,000 lei; expenditure, ordinary (est. 1939-40) 39,933,000,000 lei; public debt (Mar. 31, 1938) 117,874,300,000 lei; notes in circulation (Aug. 31, 1939) 42,351,000,000 lei; gold reserve (Aug. 31, 1939) 20,667,000,000 lei; exchange rate (Aug. 31, 1939) 655 lei=£1 sterling.

Trade and Communications.—Foreign trade (total): imports (1938) 18,768,000,000 lei; imports (Jan.-Aug. 1939) 15,877,000,000 lei; exports (1938) 21,533,000,000 lei; exports (Jan.-Aug. 1939) 16,891,000,000 lei. Communications and transport: roads, total length (1938) 67,260 mi.; railways open to traffic (1938) 2,430 mi.; airways (1937): passengers carried 7,697; mail and freight carried 36,125 kilograms; motor vehicles licensed (1937) 39,453; wireless receiving set licences (1937) 218,276; telephones, number of stations (1937) 81,205.

Agriculture and Minerals.—Production in 1938 (in metric tons): petroleum, crude 6,603,000; natural gas 1,725,000,000 cubic

metres; maize 5,098,300; (1939) 6,239,400; wheat 4,821,400; (1939) 4,488,600; barley 832,200; (1939) 1,005,600; rye 517,200; (1939) 474,500; oats 463,100; (1939) 475,900; coal 297,000; lignite 2,084,000; iron ore (metal content) (1937) 63,000; pig iron and ferro-alloys (1937) 127,000; steel (1937) 239,000; potatoes (1937) 2,016,500; beet sugar, refined 139,200; wine 10,400,000 hectolitres; manganese ore (metal content) (1937) 18,300; gold (1937) 5,465 kilograms; soybeans (1937) 70,300; rape-seed (1937) 39,300; hemp (fibre) (1937) 27,000; hempseed (1937) 23,400. Industry and labour: industrial production (1929=100) (average 1938) 131.6; unemployed, registered (average 1938) 7,271; (Sept. 1, 1939) 4,400. (See also BALKAN ENTENTE; EUROPEAN WAR.)

Running: see TRACK AND FIELD SPORTS.

Ruppert, Jacob (1867–1939), American brewer and owner of the New York Yankees baseball team, was born in New York city on August 5. As a young man he inherited his father's brewing business and expanded it into one of the most profitable in the eastern United States. He was a U.S. congressman from 1899 to 1907. With Col. T. L. Huston in 1915 he bought control of the Yankees, and under his ownership the team won ten American League championships and seven world's series. Ruppert bought Huston's interest in 1922. He died in New York city January 13.

Rural Electrification. Progress in the electrification of rural areas of the United States which has been notable since 1935 continued at an accelerated pace during the year 1939. It is estimated that over 1,700,000, or about 25%, of the farms in the United States were receiving central station service on Dec. 31, 1939—an increase of approximately 300,000 for the year. At the end of 1938 about 20.6% of the farms in the United States were receiving electric service; 1937, about 18.2%; 1936, approximately 15.4%; and 1935, about 11.6%.

The greater part of the increase in 1939, as in 1938, was accounted for by the extension of rural electric systems financed by loans from the Federal Government in accordance with the Rural Electrification Act of 1936. The number of rural consumers receiving electric power from these systems was estimated to be 400,000 at the end of 1939 as compared with 176,000 at the end of 1938. Of these consumers, 86% were farms, 6% were non-farm residences and 8% were commercial and industrial enterprises and public buildings. Of allotments totalling \$268,037,293 made by Rural Electrification Administration by the end of 1939 to 690 borrowers located in 45 States, about 91.5% had been lent to co-operative and other non-profit associations, about 6.8% to various public agencies and approximately 1.7% to utility companies. At the close of 1939 these borrowers had more than 180,000 mi. of rural line in operation and approximately 25,000 mi. ready to be energized.

Further progress in making service more widely available to farmers was achieved during the year 1939 by the Government-financed systems. Estimated average cost of line decreased to \$583 a mile during 1939 from \$768 during 1938. Among the outstanding technical advances of 1939 was the development of a low-cost, small-capacity service to enable farmers of very limited income to enjoy minimum benefits of electricity at very low cost. Wider availability of electric service to rural areas will be facilitated through the transfer of Rural Electrification Administration to the United States Department of Agriculture which became effective July 1, 1939. Increasing emphasis during 1939 was placed on aiding farmers to utilize electricity more effectively

in their home and farm activities. A group of co-operative systems reported an increase in average monthly consumption per user from 69 in 1938 to 82 kw.hr. in 1939. An appliance survey conducted during the summer of 1939 among farm consumers who had been receiving service for an average period of 10.5 months showed the following percentages of saturation: hand iron, 84; radio, 83; washing machine, 59; refrigerator, 32; toaster, 31; vacuum cleaner, 21; hot plate, 19; pump, 18; small motor, 18; cream separator, 14; and poultry lights, 10.

In Great Britain, progress resulted from the gradual expansion of rural electric supplies during 1939, it being estimated that approximately 40,000 farms were using electricity during that year. This is in contrast to about 35,000 in 1938, 30,000 in 1937 and 25,000 in 1936. Since there are about 448,000 agricultural holdings of over one acre in Great Britain, it may be seen that less than 10% of the total were electrified in 1939.

Further development of rural supplies in Great Britain was encouraged during 1939. The National Federation of Women's Institutes at its annual general meeting in June passed a resolution which stated that a supply of cheap electricity in rural areas was essential.

Interests of farmers and their associations in wider availability of rural supplies were reflected in an increase in the number of applications for consent to the erection of overhead lines and in the planned programs of the different electricity supply undertakings. Progress in isolated communities has been difficult because of many adverse factors, such as local rates, guaranteed revenues and way-leave opposition. The British Electrical and Allied Industries Research Association has been conducting a plan of research on rural electrification and had sub-committees at work during 1939 on the following phases: standardization and simplification of supply to farms; agricultural applications; and horticultural applications.

Circumstances created by the European war strongly influenced the operations of the supply undertakings during the latter part of 1939. Development and use of electricity in rural areas were affected by the scheme for rationing consumption of electricity and by the mass evacuation of townspeople to safe areas in the countryside. These conditions may have a substantial influence on the development and extension of rural electrification in Great Britain in the immediate future. (See also ELECTRICAL INDUSTRIES; ELECTRIC TRANSMISSION AND DISTRIBUTION; PUBLIC UTILITIES.)

Russell Sage Foundation. The Russell Sage Foundation was created by Mrs. Russell Sage in 1907 as a memorial to her husband. Its purpose is "the improvement of social and living conditions in the United States of America."

The original gift by Mrs. Sage was \$10,000,000, to which she added \$5,000,000 in her will. The income of the Foundation in 1939 was approximately \$575,000 per year.

The Foundation has published over 130 books and over 200 pamphlets. Printing of books, pamphlets, educational measuring scales, forms, catalogues, etc., now average more than 200,000 pieces per year. Its largest annual sale of books was recorded in 1939. Among its most recent publications are: *Social Work Year Book 1939* edited by Russell H. Kurtz; *The Master Plan*, by Edward M. Bassett; *Lawyers and the Promotion of Justice*, by Esther Lucile Brown; *Your Community*, by Joanna C. Colcord; *Housing for the Machine Age*, by Clarence A. Perry; and *Consumer Credit and Economic Stability*, by Rolf Nugent.

Ruthenia. Ruthenia or Carpathian Ukraine was constituted in the fall of 1938 as an autonomous part of the second Czecho-Slovak Republic. It was regarded at that time as a nucleus for the formation of an independent State embracing all Ukrainians under the protectorate and control of National Socialist Germany. Under the leadership of Prime Minister Mgr. Voloshin it tried to develop the Ukrainian movement through the Uno, the Ukrainian Nationalist Party, and the Sich, the militia organization of the young Ukrainians. Early in March 1939 the Central Government of Czecho-Slovakia tried to combat separatist tendencies in Ruthenia, dismissed one of the ministers, Julian Revay, and appointed General Leo Prchala as a member of the Ruthenian Government. The unrest in Ruthenia, which was soon followed by unrest in Slovakia, was the signal for the complete disintegration of Czecho-Slovakia in the middle of March 1939. Whereas German troops marched into Bohemia and Moravia, and Slovakia proclaimed her independence, Hungarian troops began to occupy Ruthenia. Their occupation put an end to the plans for an independent Ukraine which would have included the Ukrainians settled in the Soviet Union and in Poland. The Ukrainians tried to proclaim their independence and fought, supported by a few Czech troops stationed in Ruthenia, against the invading Hungarians, but their efforts were in vain. Ruthenia was occupied by Hungarian troops, the Sich was disbanded, and the whole territory of about 11,000 sq.km. with 550,000 inhabitants annexed to Hungary. The annexation of Ruthenia gave to Hungary a common frontier with Poland, put the great wealth of timber at Hungary's disposal, as well as the three great railway lines which crossed the Carpathian mountains into eastern Galicia. The conquest of Poland by Germany in Sept. 1939 and the occupation of eastern Poland by the Soviet Union created in Ruthenia a common frontier for Hungary and the Soviet Union which was of special importance in view of the fact that the Soviet Union might wish to incorporate the Ukrainians of Ruthenia into the Soviet Ukraine, and thus to achieve the unification of all Ukrainians, not under German, but under Soviet auspices.

On June 23 the Hungarian Government published a decree about the autonomous administration of Ruthenia the name of which was now changed to Carpathia. According to this decree the capital of Ruthenia is Ungvar. The autonomy which is to be exercised by officers appointed by Hungary covers the interior administration, finances and education. The Ruthenian language is admitted as second official language besides the Hungarian.

St. Kitts-Nevis: see WEST INDIES, BRITISH.

St. Louis, the largest city in the State of Missouri, extends approximately 20mi. along the Mississippi river. covers a total area of 61.3 sq.mi., and has 856,000 persons living within its corporate limits. The populous areas radiating from its boundaries hold, within a distance of 25mi., 526,000 more people. In 1939 began a transformation of the city's "front yard"—the historic levee district, a blighted vestige of a glorious past when Mississippi-steamboats plied a busy and profitable trade. After several years of delay, demolition of 40 square blocks of buildings was started. On the site will eventually rise a beautiful national park memorializing Thomas Jefferson and pioneer westward expansion. The total cost of the project will be \$30,000,000.

While these old riverfront structures were disappearing—many antedated the Civil War—private building construction showed a 30% increase over the previous year. Meanwhile, public construction brought to completion a dream long cherished by the medical centre, the \$1,000,000 Malcolm A. Bliss Psychopathic Institute. Completed also was a railroad deck of the city-owned Municipal bridge across the Mississippi, an undertaking which cost \$2,700,000 altogether and has worried local administrations for years. But their worries were just beginning; the railroads showed a reluctance to use the bridge after all. Belatedly, St. Louis decided upon a program of slum clearance and low-rent housing, with Federal aid. From Washington a \$7,000,000 loan-grant was obtained which will be used for two housing projects to accommodate 1,375 families.

Improvement of national economic conditions contributed a normal addition of new business firms and industrial plants to the commercial life of the city. The cultural life was enhanced by the Art museum, which acquired notable works by Millet, Wimar, Corot, Homer, Benton, Picasso, Sargent, Prud'hon and others. Erected on a city plaza, but not to be unveiled until the spring of 1940, was a \$60,000 group of fountain figures modelled by the famous Swedish sculptor, Carl Milles. The Municipal Opera, internationally known summer open-air theatre, presented 12 musical plays, attracting 686,045 patrons. The city's annual pageant, the Veiled Prophet parade, drew 400,000 spectators.

(E. L. R.)

St. Lucia: see WEST INDIES, BRITISH.

St. Pierre and Miquelon, a French colony comprising St. Pierre, Miquelon, and six smaller islands near Newfoundland. Language, French; capital, St. Pierre (pop. 3,396). The area is about 93 sq.mi.; the population by the latest census was 4,175 (1936), a decline of 158 since

1931. The colony is governed by an administrator and partially elected council. St. Pierre is a regular port of call for several British and French transatlantic lines. The colony enjoys excellent radio communications and cables connect it with Europe and the American continent. The sole industry is fishing, for which the islands are an important centre. The trade has, nevertheless, declined seriously in recent years, with consequent acute economic depression. Exports in 1938 totalled 14,585,000 francs, imports 19,771,000, against 12,673,000 and 13,680,000 francs respectively in 1937. The first half of 1938 showed a decided increase over 1937, with imports 9,223,000 francs and exports 14,271,000. Imports, mostly textiles, salt, wines, foodstuffs, and meat, are from Canada and the United States, who, with the other French colonies, are the best customers. Several factors combined to reduce trade: unsettled world commerce, revaluation, and elimination of the lucrative liquor traffic with the United States. The 1938 budget was balanced at 10,371,900 francs. In spite of efforts to improve the colony's economic condition, it still shows annual deficits. Monetary unit is the French franc (value: 2.25¢ U.S.). Primary education is public, supplemented by two parochial secondary schools.

(L. W. BE.)

St. Vincent: see WEST INDIES, BRITISH.

Saito, Hiroshi (1886-1939), Japanese diplomat, was born at Niigata in the province of Echigo, Japan, December 24, and was educated at Peers college and the University of Tokyo, where he received a law degree in 1910. That same year he entered the Japanese diplomatic service. In 1922 he was a delegate to the naval conference in Washington; later he was consul in Seattle, consul general in New York city, and from 1934 to 1938 Japanese Ambassador to the United States. In 1930 he was attaché to the Japanese embassy in London and the next year minister to The Netherlands. Prior to his appointment as Ambassador to the U.S.A. he was senior counsellor to the embassy at Washington. Saito was author of *Japan's Policies and Purposes*, published in the United States in 1935. He died in Washington, D.C. on February 26, four months after retiring because of ill health.

Sales: see RETAIL SALES.

Sales Tax: see TAXATION.

Salvador, El, smallest of the Central American republics, located on the Pacific Coast; language, Spanish; capital, San Salvador (pop. 136,845); president, General Maximiliano Hernández Martínez. The area is 13,172 square miles. The population by the June 1937 census was 1,631,967, with 38% urban, and was officially estimated at 1,685,827 in June 1938. Government is in the hands of the president-dictator, General Martínez. On Jan. 20, 1939, his term of office, due to expire March 1, 1939, was extended to Jan. 1945 by the Constitutional Congress which drew up and adopted a new Constitution. This document did away with the office of vice-president, put the appointment of mayors in presidential hands, and required compulsory suffrage of all adult male citizens. A plot against the Government just before the Constitution was promulgated was quickly put down by troops already mobilized, and the country remained quiet throughout the rest of the year. A new press law was passed by the Congress Jan. 30, restricting publication and editing of all except purely scientific publications to native-born Salvadoreans. Refugees from Europe were refused admission to Salvador by an order issued in July denying entry to "any person expelled from another country." Trade agreements with German firms were cancelled in September when the European war broke out, without losses to

local merchants. Merchandise already received from Germany had exceeded in value the sum of askimark credits held by Salvador.

El Salvador has 604km. of railway, and a rapidly improving highway system featured by a good dirt road as its section of the new Pan American highway.

The principal products are corn (for domestic consumption) and coffee. In 1938 coffee accounted for 87% of the exports, a drop from 91% in 1937. The 1939 coffee crop was estimated to exceed that of 1938, but loss of the German market was expected to hurt this important industry. In 1938, foreign trade declined 22.5% over 1937. Exports amounted to 27,365,000 colones and imports to 22,867,000. The United States took 61.8% of the exports and furnished 46.7% of imports, an increase from 40.4%, at the expense of Germany's share in the trade. The monetary unit is the colón (value 40¢ U.S.). Public school enrolment in 1938 was 89,839, with 11.9% of the national budget allotted to education.

(L. W. BE.; C. N. G.)

Salvation Army. The year 1939 was an important one in "the Salvation Army world"—a sphere which embraces some 18,000 corps and employs some 30,000 commissioned officers doing religious and social service work among the less privileged classes of 97 countries and colonies the world around.

The year saw the retirement of General Evangeline Booth, daughter of the Army's founder and one of the most striking women personalities of the 20th century. General Booth, at 73, in obedience to a retirement regulation partly created by herself, surrendered her office to her successor, General-elect George L. Carpenter. The election of the new international head of the Army was effected by the balloting of members of the High Council, convened in London for this purpose during the month of August.

General Carpenter, an Australian by birth and for many years prominent in the organization's literary and executive departments, previously commanded the Army's forces in Canada and South America, advancing its interests in those lands by his progressive and democratic policies.

The year 1939 also witnessed a broadening of a comparatively modern phase of Army ministry: character-building, or "preventive," work among young people. While in no wise slackening its rescue and rehabilitative labours among those whom society at large stamps incorrigible, Salvationists last year pushed the development of a many-phased youth program, creating boys' clubs, Life-Saving Scout, and Guard units (similar to, and in some cases allied with, the Boy and Girl Scouts), summer camps for the young, Torchbearers' clubs (for the evangelization of youth by youth), and many other departments catering to the educational and spiritual needs of boys and girls.

Indicative of the public's increasing acceptance of the Army's peculiar evangel is the increased circulation given its 129 periodicals, chief among which is *The War Cry*, the several editions of which average close to 2,000,000 copies per week. During 1939, *The War Cry's* circulation increased by many thousands per week. For example, the four editions printed in the United States, combining for a national Christmas issue, sold 1,900,000 copies for that single number, said to be the largest circulation ever given a religious journal in America.

But perhaps the most striking service performed by the Salvation Army in 1939 was its quick establishment, on many fronts, of its war work operations. Already labouring during the early months of the year among war victims in China, and courageously tackling the gigantic problem of caring for refugees and orphans left by the Spanish conflict, the declaration of war between Germany and France and England found the Army ready in the competent tradition which gained for it acclaim during 1914-18.

Its naval and military homes, in strategic spots around the world, promptly enlarged their services. A trained force of workers, skilled in the arts of ministering to the comforts of soldiers in front-line positions, was immediately dispatched to the war zones. Huts and canteens, more than 100 in number, were opened in and near virtually all large military and naval bases in Great Britain, France and Finland. In co-operation with governmental agencies, Salvationists and their many institutions of mercy lent invaluable service in the evacuation of children from large cities such as London and Paris.

(E. J. P.A.)

Samoa, American, a possession of the United States of America, lies about 2,700 miles east of the northern tip of Australia and 2,200 miles south of the Hawaiian islands; comprises the island of Tutuila and all other islands of the Samoan group E. of longitude 171° W., including Rose island, Tau, Olosega, Ofu, Aunuu, and Swain's. The principal island is Tutuila, area about 40 square miles. Pago Pago, the capital, population about 1,000, has the safest and best harbour in the South seas. Total population on July 1, 1939, 12,785, including 12,562 natives of Samoa (Polynesians); the remainder are foreign born and personnel of the U.S. Naval establishment.

Public schools had an average enrolment of 2,823 during 1938-39. Health and sanitary conditions are excellent. All medical attention is given by naval medical officers who treat the people free of charge. The only bank is the Bank of American Samoa, conducting a commercial banking business as a division of the Treasury of the Naval Government of American Samoa, which owns the capital stock. Copra is the chief export of importance: 1,400 tons, returning \$55,324, were exported during the fiscal year 1939; 360 tons of mats, rugs, and native curios, returning \$47,000, were also exported during the year. The island is solvent and receives no financial aid from the U.S. Government. (L. S. F.)

Samoa, Western: see MANDATES; PACIFIC ISLANDS, MANDATED.

Sand and Gravel. The leading uses of sand and gravel are in building construction and road paving; these account for 80% of the sand and 90% of the gravel consumption of the United States; the only other important use of gravel is as railroad ballast, which takes all but 1% of the remainder, but with sand, ballast accounts for only 2%, while the railroads use an additional 3% as engine sand; there are a number of industrial uses, the most important ones being in foundry work (8%), glass making (4%), and abrasives (1%). The total production decreased by 4% in 1938, as compared with 1937, reaching 57,114,000 short tons of sand and 124,206,000 tons of gravel, a total of 181,320,000 tons.

The combined output of sand and gravel in Canada increased by 13% in 1938 to 30,557,000 short tons. Production in the United Kingdom is less than in Canada, amounting to 21,307,000 long tons in 1937. Of this total 73% was used by the building industry and 18% for road metal and ballast. (G. A. Ro.)

Sand Island: see MIDWAY ISLANDS.

Sandstone: see STONE.

San Francisco, California, U.S.A., central port, financial and marketing centre of the Pacific coast, known as the "City by the Golden Gate;" area, 44.82 sq.mi.; population according to the U.S. census of 1930, 634,394, estimated Jan. 1, 1940, 776,260. Of the city's population, 235,298 were (1930) native whites of native parentage, or 37.1%; 206,285 native whites of foreign or mixed parentage, or 32.5%; 153,386 foreign born

whites, or 24.2%; 39,425 Negroes or of other races, or 6.2%; 338,033 males and 296,361 females.

More than \$100,000,000 of major construction was under way at the turn of the year in the San Francisco Bay Area with approximately \$50,000,000 in a shipbuilding program, \$35,000,000 in naval supply and naval air bases and other Federal projects on Government Island and the agricultural laboratory at Albany. In addition \$15,000,000 will be spent by the Pacific Gas and Electric company for the construction of three power plants in Contra Costa county in the vicinity of the refineries of the Tidewater Associated, Shell, and Union Oil companies. The \$10,000,000 aeronautical research station at Sunnyvale will also be under way.

The 1939 Golden Gate International Exposition brought 10,496,203 visitors to Treasure Island. Of this total, approximately 4,900,000 persons went via the San Francisco-Oakland Bay bridge. Preliminary estimates on the value of the Exposition to the San Francisco Area, presented by the San Francisco Chamber of Commerce, indicated that approximately \$70,000,000 was expended by visitors to the San Francisco Bay Area.

Education.—There are 181 public schools in San Francisco, including 72 kindergartens, 82 elementary schools and 26 high schools, supplemented by numerous private, parochial, non-sectarian and technical schools. It is estimated that there are several thousand children in the city attending private schools. The University of San Francisco and the San Francisco State Teachers' college are located in the city and the University of California at Berkeley, and Stanford university at Palo Alto, are both within easy commuting distance of San Francisco. In addition, the University of California maintains several branches in San Francisco, including colleges of medicine, dentistry, pharmacy and law, and the California School of Fine Arts; Stanford university's colleges of dentistry and medicine are also located in San Francisco.

Trade.—San Francisco contains the most compact market in the West, with 15,105 persons per square mile. Only New York, Boston and Philadelphia exceed this density. The effective buying power of these people is the equivalent of 1,127,675 "average" Americans. The effective buying income per family in San Francisco amounts to \$3,360, compared to \$2,893 in California, \$2,788 in the Pacific Coast, and to \$2,392, the average for the nation. The retail sales in San Francisco are estimated at \$300,000,000, and wholesale sales at the tremendous sum of \$1,400,000,000. Sales at retail per capita amount to \$443, leading all other key cities of the coast. Sales at wholesale exceed those of any other coast city.

Transportation.—Converging in San Francisco are seven major transcontinental rail routes, 177 steamship lines, more than 30 truck lines, four transcontinental bus services, three transcontinental air transport routes and the famous transpacific Clipper fleet. Today, San Francisco is the terminus of four Class I railroads and a number of short lines. Since the San Francisco-Oakland Bay bridge was opened on November 12, 1936, it has been crossed by 28,650,000 vehicles and more than 80,000,000 passengers have been carried over the bridge by motor vehicles or commuters' trains. The bridge has taken in \$15,300,000 and it is estimated it has effected a saving of \$10,268,000 to motorists in lowered fares. During the three years it was estimated that motor vehicle mileage over the bridge amounted to 236,362,500 and that a total of 14,772,656 gal. of gasoline were consumed at an estimated cost of \$2,732,941, and that the State gasoline tax on this gallonage amounted to \$443,179. (G. L. N.)

San Marino, a tiny republic of 38 sq.mi. in the Apennines, S.W. of Rimini, entirely surrounded by Italian territory, is ruled by a Grand Council and two Regents ("Capitani Reggenti") appointed therefrom to exercise executive powers. The population (Sept. 1938) was 14,389, giving a density of about 379 per square mile. The capital (of the same name) has about 2,000 inhabitants. There is an electric railway to Rimini. Italian currency is in use, but there is a local silver coinage, and a separate issue of postage stamps. The budget estimate for 1938-39 balanced at 5,474,673 lire.

Sargent, John Garibaldi (1860-1939), attorney-general of the U.S.A. during the presidency of Calvin Coolidge, was born in Ludlow, Vt., on October 13 and was educated at Tufts college. Admitted to the bar in 1890, he became attorney-general of Vermont in 1908. Coolidge appointed him to the cabinet in 1925 after the U.S. Senate had withheld confirmation of Charles Warren as attorney-general. He died in the town of his birth on March 5.

Saskatchewan, the middle of the three prairie provinces of Canada, was created a province by the Dominion Parliament Sept. 1, 1905. It has a total area of 251,700 sq.mi.; population 949,000 (estimate, Dominion Bureau of Statistics, 1939). The seat of Government is Regina.

History.—The Liberal Party, elected June 8, 1938, continued in power under the premiership of W. Patterson. There were no political or other happenings of special significance during 1939.

Economic.—The wheat crop for 1939 (wheat growing is the first industry of the province) was 239,000,000 bu. as compared with 132,000,000 in 1938, and 37,000,000 in the drought year 1937. Other grain crops were in bushels, oats 115,000,000 (90,000,000, 1938), barley 26,000,000 (20,000,000, 1938), rye 9,300,000 (3,400,000, 1938) and flaxseed 1,150,000 (725,000, 1938). The total value of all field crops for 1939 is estimated at \$165,150,000 as compared with \$101,388,000 for the previous year, a gain of 63%. Aggregate farm capital has now reached approximately \$1,000,000,000. Other main sources of income were minerals \$7,782,847, manufacturing, \$62,205,884, fisheries \$468,646, for 1938. Incomplete figures show these were exceeded in 1939. Mining progress in the north of the province was reflected in the addition of 26,500 h.p. to the hydro plant at Island Falls on the Churchill river and a new installation (3,300 h.p.) at Wellington lake on Charlot river for use at Goldfields. (J. T. C.)

Sassoon, Sir Philip (ALBERT GUSTAVE DAVID) (1888-1939), British statesman, was born December 4 of a distinguished Jewish family, the British branch of which had been founded by his great-grandfather. He was educated at Eton and at Christ Church, Oxford. Sir Philip entered Parliament in 1912 at the age of 23 and was at that time its youngest member. During the World War he was private secretary to Field Marshal Sir Douglas Haig, commander in chief of the British armies in France. He was twice under-secretary of state for air, from 1924 to 1929, and from 1931 to 1937. In 1937 Neville Chamberlain appointed him first commissioner of works in his cabinet. Sir Philip was a bachelor and was believed to be one of England's wealthiest men. He died in London on June 3.

Saturn: see ASTRONOMY.

Saudi Arabia: see ARABIA; ISLAM.

Sauveur, Albert (1863-1939), American metallurgist, was a native Belgian, born at Louvain on June 21. He was educated at the Athénée Royal in Brussels, at the School of Mines in Liège, and at the Massachusetts Institute of Technology, where he received his bachelor's degree in 1889. Many of his colleagues called him a founder of the science of metallography, and he was thus cited in an honorary Sc.D. degree from Harvard in 1935. He joined the faculty of Harvard in 1889 and was professor of metallurgy there from 1905 until his retirement in 1935. As one of the acknowledged world's experts on the metallurgy of iron and steel he was called upon during the World War to advise the American Aviation Commission in France and the French Ministry of Munitions. His many honours included the Bessemer gold medal of Great Britain in 1924 and the first Albert Sauveur achievement medal of the American Society for Metals. He died at Boston on January 26.

Savings Banks, Mutual. Assets and deposits of mutual savings banks in the United States increased in the year ending July 1, 1939. Total assets were \$11,741,000,000, on July 1, 1939, an increase of \$213,900,000 over July 1, 1938, as compared with an increase of \$40,400,000 during the year ending July 1, 1938. Deposits credited to 15,400,112 accounts reached a new high of \$10,390,000,000 on July 1, 1939. The combined surplus remains unchanged at \$1,314,000,000 or 12.60% of total deposits. Dividends averaged 2.17% in 1939, a slight decrease from the average of 2½% in 1938. Decreases by individual institutions were announced to become effective during the second half of 1939. During the year two banks were absorbed by mergers reducing the total number of banks to 541.

Although Government bonds continued to be the chief outlet for investments, there was evident a renewed activity in new mortgage loans. Approximately 22% of such loans made during the six months ending June 30, 1939, were insured by the Federal Housing Administration. Nearly 40% of all the savings banks have become "approved mortgagees" under the Federal Housing Act and are, therefore, in a position to make insured loans. This type of loan has been well received by the public. An important reason for its popularity is the elimination of the second mortgage and by virtue of the system of regular monthly payments of interest on principal it is possible for the Government agency to insure loans up to 90% of the appraised value of the property. The Federal plan has done much to demonstrate to borrowers the desirability of reducing their mortgage debt periodically.

Progress is being made in converting old mortgage loans to an amortized basis under which loans are repaid in fixed and regular small instalments. This development was in large part a result of the education of borrowers by the activities and example of the Federal Government, both in the Home Owners Loan Corporation and the Federal Housing Administration.

Perhaps the outstanding development in 1939 in the mutual savings banks was the establishment of insurance departments in New York banks. The law permitting savings banks in New York State to establish an insurance department became effective Jan. 1, 1939, and on January 6 three banks in New York city opened their insurance departments for business. A bank in Rochester followed suit on January 24, and in April a bank in Troy and another bank in New York city joined the list of issuing banks. In addition to the six issuing banks, seven banks located in various parts of the State have become agency banks. By October 1 there was \$5,574,000 of insurance in force representing 6,699 policies. In Massachusetts, the first State in which savings bank life insurance was sold, it was over eight years after the first policy was sold before the total insurance in force exceeded \$5,000,000. Now, after 31 years in the field, Massachusetts banks have over \$170,000,000

in force representing more than 190,000 policies. At present there are in the State of Massachusetts 26 issuing banks and 101 agency banks. As a result of the interest created by the passage of the New York law similar bills were introduced in the States of New Jersey and Ohio.

The unsettled international conditions had little evident effect on savings in Great Britain. During the year ending April 30, 1939, balances in Trustee Savings Banks increased £16,000,000 to a total of £284,200,000 while the balances in the Post Office Savings bank rose from £654,000,000 to £694,000,000. As of March 31, 1939, the National Savings Certificates outstanding totalled £518,900,000, an increase of £2,100,000 during the preceding 12 months.

In France, savings banks did not enjoy an uninterrupted growth in deposits during the year ending May 31, 1939, although the net change for the year was an increase of 2,000,000 francs to a total of 41,000,000,000 francs. Under the decree-law of Nov. 12, 1938, a limitation of 20,000 francs was placed on the amount of deposits that may be paid into an account in any one year after July 1, 1939. This decree was not received favourably by the banks.

In Germany, the Savings Bank Federation issued a special edition of its fortnightly publication to commemorate the passing of a century since the promulgation of the "Regulations Concerning the Organization of Savings Banking." These regulations are still the basic laws under which the savings banks operate although amendments have been made, such as the reorganization decree of 1932.

(HE. BR.)

Sayre, Francis Bowes (1885—), U.S. statesman and attorney, was born April 30 at South Bethlehem, Pa. and received his A.B. degree from Williams college in 1909 and his LL.B. degree from Harvard three years later. In 1913 he was married to Jessie Woodrow, daughter of President Wilson, at the White House (she died Jan. 15, 1933). He was deputy assistant district attorney of New York county in 1912-13, assistant to the president and instructor in Government at Williams college from 1914 to 1917, and a teaching fellow in 1917-18 at Harvard Law school, where he received a doctorate of juristic science. From 1919 until 1934 he remained on Harvard's faculty, first as assistant professor, then full professor of law and director of the university's Institute of Criminal Law. He was an adviser in foreign affairs to the Siamese Gov't from 1923 to 1925 and during the next five years, as jurisconsult to the ministry of foreign affairs, negotiated many important political treaties which eventually abolished extraterritoriality in Siam. He was appointed assistant U.S. secretary of State by President Roosevelt in 1933 and in this position directed the negotiation of reciprocal trade agreements under Cordell Hull. He had been chairman of the U.S. Interdepartmental Committee on the Philippines since 1934, and on July 26, 1939 President Roosevelt appointed him U.S. high commissioner to the Philippines to succeed Paul V. McNutt. Sayre is the author of case-books on criminal, labour and admiralty law; also of *America Must Act* (1935).

Sbarretti, Donato (1856-1939), Italian cardinal, was known as one of the staunchest supporters of fascism in the administration of the Roman Catholic Church. Born on November 12 at Montefranche, near Rome, he received doctorates in both law and theology, and was ordained priest April 12, 1879. Entering the diplomatic service of the church, he was appointed a member of the papal delegation sent to the United States in 1893 to establish an apostolic mission. Later he was apostolic delegate to the Philippines and, in Jan. 1900, he was made Bishop of Havana. Thereafter he was apostolic delegate to Canada for ten years before he returned to Rome to

become assessor of the holy office. On Dec. 4, 1916, Pope Benedict XV created him a cardinal. Pius XI made him a cardinal bishop and vice dean of the Sacred College. At the time of his death in Vatican City on April 1, he was secretary of the congregation of the holy office.

Scheidemann, Philipp (1865-1939), German statesman, was born at Kassel on July 26. He entered the Reichstag in 1903, later became leader of the Social Democrats, and proclaimed the German Republic Nov. 9, 1918. At the Weimar assembly in 1919 he was selected first Chancellor of the republic but resigned in June 1919 rather than sign the Treaty of Versailles. He went into exile in 1933 and died at Copenhagen November 29. See *Encyclopædia Britannica*, vol 20, p. 63.

Schelling, Ernest Henry (1876-1939), U.S. composer, pianist and conductor was born July 26 at Belvidere, New Jersey. After studying for four years under Paderewski in Switzerland he began his career as a concert pianist with a successful tour of Europe. During the World War he served with the American Expeditionary Forces in France and was awarded the Distinguished Service medal. Later he conducted children's concerts for the New York Philharmonic and other orchestras and from 1936 to 1938 was conductor of the Baltimore Symphony orchestra. Among his compositions for orchestras are *Légendes Symphoniques*, *Symphony Fantastic Suite*, *Impressions*, *Morocco* and *Victory Ball* (based on the poem by Alfred Noyes). He died in New York city December 8.

Schizophrenia: see NERVOUS SYSTEM; PSYCHIATRY.

Schneider, Herman (1872-1939), U.S. educator and engineer, was originator of the co-operative plan of education in American universities, whereby students are employed in private industry, while pursuing their studies. Born in Summit Hill, Pa., on September 12, Schneider as a youth was a carpenter's apprentice and paid for his education at Lehigh university by working in an engineering office. His experience with alternate study and work in industry led him to formulate his own theories of practical training in engineering. He gave up practice as an engineer and specialist in structural iron work to accept an instructorship at Lehigh in 1899, and four years later he became assistant professor of civil engineering at the University of Cincinnati. In 1905 he persuaded the administration of the university to introduce the co-operative plan into its engineering curriculum.

The success of the plan was such that it was later adopted, in one form or another, by most of the large American schools of technology and engineering, and even by colleges of commerce and liberal arts. Schneider was president of the University of Cincinnati from 1929 to 1932 and dean of its college of engineering and commerce until his death on March 28.

Schwab, Charles Michael (1862-1939), American industrialist and financier, was born at Williamsburg, Pa. on February 18. After a brief education he was employed as a stake-driver by the Carnegie Steel company in 1881; by 1897 he was president of the company, and in 1901, when it merged with the U.S. Steel corporation, he became first president of the latter. About two years later he organized the Bethlehem Steel corporation. During the World War, prior to America's entry, his company sold steel and steel products to the Allies valued at more than \$200,000,000. When the United States entered the war, Schwab was chosen as director-general of the

Emergency Fleet corporation, a position he held until after the Armistice, when he returned to the Bethlehem Steel corporation as chairman of its board of directors. From 1926 to 1932 he was president of the American Iron and Steel institute. He died in New York city on September 18. See also *Encyclopædia Britannica*, vol. 20, p. 111.

Scotland: see GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.

Sculpture. Sculpture proved itself in 1939 in many ways one of the most flourishing of the arts. It revealed this status in the exhibition field, in the completion of public monuments and memorials, in the acquisitions of sculpture by public collections, and by various projects initiated for the use and promotion of sculpture. The two international expositions held in the United States gave striking illustrations of sculpture's prominence in the art field and afforded sculptors an additional stimulus to creation. Some notable achievements were recorded both in America and in Europe.

Though the European war inevitably tended to dislocate plans for sculptural work in Europe, leading nations made definite attempts to foster the continuance of art expression and to provide commercial outlets for their talents.

The democratization of art under the influence of the Government Works Progress Administration continued to stimulate sculpture both in practice and appreciation, and was instrumental chiefly in encouraging new talents through the means of enabling them to participate in open competitions for public art works. Local Federal art projects, functioning on a relief basis, provided much useful and attractive sculpture which was allocated to schools, libraries, hospitals, and other publicly supported institutions. National exhibitions in the larger cities served best to illustrate the trends of the times, which were suggested by work in new experimental forms. A strong current of social consciousness was perceptible in many sculpture shows, reflecting the popular trend of the Federal program.

At the New York World's Fair the solid architectural masses of the main exhibit area were relieved and enhanced by striking sculpture groups, heroic figures representing a wide variety of historical, mythological, and modern subjects. In size the figures ranged from the 65ft. statue of George Washington, dominating the main mall, to the sprightly terra cotta figures of modern cherubs in one principal fountain display. The 35 sculptors who conceived the work were chosen by the board of design and represented noted as well as little known artists. Sculpture also figured prominently in the decorative pattern of the San Francisco Exposition. In both instances the sculpture was largely of impermanent construction, and not destined generally for lasting preservation.

In the exhibition field the Whitney Museum of American Art again served to bring together one of 1939's most comprehensive groups of sculpture by contemporary artists. Opportunity for the exhibition of recent work was afforded a large number of young and older artists, however, through an outdoor exhibition held in New York, N.Y. by the newly organized Sculptors' Guild. The 120 exhibits by 60 sculptors, displayed in a vacant lot adjoining one of New York's principal thoroughfares, were shown throughout the spring and early summer of 1939, and attracted particular attention. The major event in the historical field, on the other hand, was the display of early Roman sculpture and other art held by the Metropolitan Museum of Art to celebrate the anniversary of the Emperor Augustus. This was noted especially for its classical portraiture and threw a revealing light on the art and personalities of the Augustan era in Rome.

THE LAST of Gutzon Borglum's giant stone heads of four American presidents—that of Theodore Roosevelt—was unveiled on Mount Rushmore, South Dakota, July 2, 1939

Above: "EUROPA," by Gleb W. Derujinsky, at the New York World's Fair in 1939

Right: "MOSES" by Alexander Archipenko, completed in 1939

Centre: "LEWIS AND CLARK," cast-stone relief for the Department of Interior building, Washington, D.C., by Heinz Warneke, installed May 16, 1939

Below, left: "STABILE," an abstraction in Plexiglass by Alexander Calder, won first prize in a national competition and was exhibited at the New York World's Fair in 1939

Below, right: "GUARDIAN OF WATER" by Donal Hord for the San Diego civic centre, dedicated June 10, 1939

Leading museums were fortunate in acquiring several notable sculptures. The Frick collection, opened as a public institution several years ago, obtained a life-size terra cotta statue of Diana the Huntress by the French 18th century sculptor, Jean Antoine Houdon, thereby taking possession of the only replica in terra cotta which Houdon made of one of his most celebrated figure subjects. The statue once belonged to Cardinal Fesch, uncle of Napoleon. The acquisition by the Toledo museum of a stone relief by Desiderio da Settignano of "St. Cecilia" also marked an important addition to the public collections of Renaissance sculpture in its most exquisite form, through the gift of Edward Drummond Libbey. Except for several pieces acquired by museums devoted to latter-day art, such as the Whitney museum and the Museum of Modern Art, contemporary acquisitions were few and not such as to give great importance to any particular artist.

The unveiling of Jo Davidson's statue of Will Rogers, the cowboy humourist and philosopher, in the statuary hall at the national Capitol in Washington, marked a principal addition of 1939 to the store of public sculptural monuments. Presented by Oklahoma, it serves as a valued instance of the public's interest in sculpture as a means of commemorating a national personality. Others completed were a bronze statue of Walt Whitman by the same artist, to be set as a monument to the poet in the Palisades Interstate park, New York, and a symbolical group entitled "Meeting of the Rivers" by Carl Milles, erected at St. Louis, near the junction of the Mississippi and Missouri rivers.

The year's most celebrated controversy was that created in London in June by the exhibition of Jacob Epstein's squat 7ft. figure of Adam, carved in a three-ton mass of alabaster. Considered "shocking" by some, it exemplified for others "the story of man's evolution from the primitive—a figure more powerful than the most powerful animal." There were few such sensations, however, in the year. (See also ART EXHIBITIONS.) (C. BU.)

*Ratio of secondary recovery to consumption of new metal.

†Includes some in chemical compounds.

turn to industry for re-use has grown to such an extent that in many cases the yield is so large a proportion of the total consumption that the consuming industries would be seriously handicapped without access to this additional supply; on the other hand, secondary recovery is viewed unfavourably by the primary producer, because it restricts the demand for new metal.

Very little information is available on secondary recovery outside of the United States. No other country has developed it to the degree prevailing in the United States, but pressure of circumstances has probably pushed it farther in Germany than elsewhere.

Indirect data from Germany indicate a secondary copper recovery of 80,900 metric tons in 1938, or 22% of the new supply; lead recovery was 22,500 tons, or 9% of new supply; and zinc recovery was 15,200 tons, or 6% of new supply. (G. A. Ro.)

Seeing Eye, the corporate society that educates dogs to be the trusted guides and friends of blind men and women, had in 1939 the most successful year since its inception in 1928 when Mr. Morris Frank brought his German shepherd, Buddy, from Mrs. Harrison Eustis's kennels in Switzerland. Bred for "character" and trained by Mrs. Eustis and Mr. Elliott S. Humphrey, the geneticist, Buddy was the dog that proved 'Seeing Eye dogs could safely guide blind people through heavy American street traffic; and it is primarily due to her that in 1939, 450 dogs were leading their 450 blind owners from darkness and dependence into light and liberty. Even in death—for Buddy drew her last faithful breath, in the summer of 1938, still by her master's side—she continues her Seeing Eye work. Mr. Frank now has a handsome male dog for guide and friend; but the first "buddy" is not forgotten.

Seeing Eye dogs are now working in 45 of the United States, and in the District of Columbia, and in Canada. Some dogs are "attending college" as pilots to student masters; others are engaged as guides in such diversified occupations as the law, teaching, the ministry, journalism, music and a great variety of mercantile pursuits, including selling insurance and groceries, and raising poultry. In addition to the increased number of trained dogs produced in 1939 for those blind persons mentally and physically capable of benefiting from a dog, the Seeing Eye made notable progress in informing a sympathetic public of the Seeing Eye's need for financial support—each dog costs many times the amount paid by the blind purchaser.

BIBLIOGRAPHY.—Ruth Adams Knight, *A Friend in the Dark* (1937); Alice Crewe and Fleming Gall, *Each in his Way* (Oxford, 1937); *The Story of The Seeing Eye* (The Seeing Eye, New York, 1938). (B. TA.)

Seismology maintained progress through August, and it is not possible (Jan. 1, 1940) to appraise the effects of events after that date. Major earthquakes in central Chile on Jan. 24, 1939 and in central Turkey on December 27 caused widespread destruction and loss of life. Severe aftershocks followed the earthquake in Turkey, continuing into the new year and adding to the destruction. (See also CHILE.) A destructive earthquake on June 18, at Accra, Gold Coast, Africa, was in a rather unusual locality.

Strong earthquake motion has been measured, and has been analyzed by mechanical as well as by mathematical methods. Information thus obtained has been applied to the design of many kinds of structures, including dams, bridges, water towers, and buildings. Models of proposed structures have been tested on shaking platforms constrained to reproduce actual earth motions. Effec-

tive building construction codes have been adopted where necessary and are being improved as information is perfected.

A seismograph has been adapted to the conditions to be encountered by the U.S. Antarctic Expedition.

Study of deformation of the earth's crust by laboratory methods has been continued, with pressures up to 50,000 atmospheres, corresponding to a depth of 100 miles.

Though general earthquake prediction is regarded as impossible, attention has been given to the possibility of determining whether stress is growing in the crust which may lead to earthquake, by means of triangulation, levelling, tilt measurement, and listening to sounds possibly related to earthquake along great fault planes.

(N. H. H.)

Selenium. The bulk of the selenium output of the world is as a by-product in copper refining in the United States and Canada; Sweden, the Soviet Union, Mexico and Japan have some production, but no statistics are available. Production in the United States amounted to 435,800lb. in 1937, declining to 225,700 in 1938, with imports of 101,072 pounds. Production began in Canada in 1931, and reached 397,200lb. in 1937. The chief use is in the glass industry as a decolorizer and as the colouring agent for red or ruby glass; other uses are in pigments, rubber vulcanization and flame-proofing; one of the most promising of the newer uses is the addition of selenium to copper alloys and steels to improve the machinability.

(G. A. Ro.)

Seligman, Edwin Robert Anderson (1861-1939), U.S. economist, was born in New York city on April 25, the son of the founder of the banking firm, J. & W. Seligman and Company. He was tutored as a child by Horatio Alger, author of boys' books. In 1879 he received his bachelor's degree from Columbia university, in 1884 his M.A. and LL.B., and in 1885 his doctorate of philosophy. At the age of 20 he began his famous collection of 50,000 books and pamphlets which he sold in 1930 to Columbia university for \$500,000—one-half its estimated value. In 1885 he was appointed a lecturer in economics at Columbia and he remained on the faculty as professor of political economy and finance until his retirement in 1931. Meanwhile he had served on a number of taxation committees and his advice on economic policies was sought by nations the world over. In 1922 and 1923 he was an expert on the League of Nations committee on economics and finance, and from 1918 to 1925 he was a special adviser to the Ways and Means committee of the U.S. House of Representatives. Perhaps the most famous of his commissions was his study of the tax structure of Cuba. In 1931 he completed a report which became the basis of Cuban tax laws and attracted the attention of economists generally for its omission of consumption taxes and its emphasis upon direct levies. Seligman opposed all forms of the sales tax which he deemed unjust. He was the author of some 15 volumes on taxation and general economic subjects, including *The Income Tax* (2nd ed., 1914), *Essays in Taxation* (10th ed., 1925), *Principles of Economics* (12th ed., 1929), *The Economics of Farm Relief* (1929), *Price Cutting and Price Maintenance* (1932), and *Economic Interpretation of History* (2nd ed., 1937). He died at Lake Placid, N.Y., July 18.

Serum Therapy. Serums of various types, as well as anti-toxins, toxin-antitoxins, toxoids, vaccines and other immunizing agents are being widely employed for the

diagnosis, modification, prophylaxis and treatment of disease. During 1939 two chemotherapeutic agents, 'sulphanilamide and sulphapyridine, have been employed, alone or in combination with immunizing agents, for the treatment of many diseases previously amenable only to the immunizing agents.

Diseases which are treated by the use of serums, vaccines, etc., are acne caused by the bacillus acne, anthrax, bacillary dysentery, botulism, diphtheria, erysipelas, gas gangrene, measles, meningococcic meningitis, plague, pneumococcus pneumonia, pneumococcus meningitis, scarlet fever, snake bite (North American—rattlesnake, copperhead, water moccasin; South American—fer-de-lance and other *Bothrops*, and British—cobra and viperine), staphylococcus and streptococcus infections, tetanus, tularemia and undulant (Malta) fever.

The use of typhoid vaccines in the treatment of typhoid has never become well established, and the use of immunizing agents in the treatment of whooping cough is still experimental.

Diseases in which diagnosis is confirmed by the use of serums and related preparations include chancroid, diphtheria, leishmaniasis, tuberculosis, scarlet fever, typhoid, paratyphoid, typhus and undulant fevers. Experiments have been conducted with the diagnosis of meningitis and whooping cough, but such procedures are not established.

The following diseases may be prevented by the use of immunizing agents: cholera, diphtheria, gas gangrene, measles (which may also be modified so that permanent immunization occurs), rabies, smallpox, tetanus, scarlet fever, typhoid, paratyphoid and typhus fevers. Some experimental work has been done in attempts to prevent erysipelas and chancroid, but the work is not well established.

Typhoid vaccine continues to be employed in non-specific protein therapy, and normal horse serum is used in certain haemorrhagic conditions.

Convalescent human serum has been used in the treatment of measles and scarlet fever, and experimentally for the treatment of poliomyelitis and the prevention of mumps and chicken-pox. Human serums have been used in the treatment of shock, haemorrhage and burns.

Serums are available for the treatment of all types of pneumonia from I to XXXII, and of these, serums for Types I, II, V, VII and VIII have become official preparations, both as horse serums and as the newer rabbit serums.

Immune globulin (human), as well as convalescent serum, is used in the prevention, modification and treatment of measles. Experimental work continues with well-controlled studies of Phase I whooping cough vaccine. The use of oral vaccines for the prevention of the common cold and typhoid fever is not established. There are still no established immunizing agents for the treatment or prevention of the common cold, influenza, gonorrhoea or poliomyelitis. (See also COLD, COMMON; PNEUMONIA.) (P. C. B.)

Sharpening Stones. The name sharpening stones is used to designate the small, hand operated varieties of stones used for sharpening tools, as distinguished from the large power-driven grindstones. Scythstones and whetstones are produced from schist in New Hampshire and Vermont; rubbing stones from sandstone in Indiana and Ohio; and oilstones from novaculite in Arkansas and Kansas. The tonnage is small (511 short tons in 1938), but the small size of the units permits this amount to cover an extensive use.

(G. A. Ro.)

Shasta Dam: see DAMS.

Sheep. The number of sheep and lambs on United States farms Jan. 1, 1940, was estimated by the Department of Agriculture as 54,473,000 head, valued at \$342,893,000, compared to 53,783,000 head valued at \$309,280,000 a year earlier. The average price of sheep and lambs per head was reported as \$6.29 Jan. 1, 1940, and \$5.75 Jan. 1, 1939.

Of the increase of 690,000 head, 177,000 were sheep and lambs on feed for market and 513,000 were stock sheep. Stock sheep in the United States Jan. 1, 1940, numbered 48,473,000; a year earlier, 47,960,000.

New Zealand, one of the largest producers, reported a decline: 31,858,000 as of April 30, 1939, compared to 32,379,000 a year earlier. Figures from official sources and from the International Institute of Agriculture show the number of sheep in different countries in 1939 and 1938 as follows:

	1939	1938
Canada	3,365,800	3,415,000
United Kingdom	26,903,700	26,775,400
England and Wales	17,976,000	17,912,500
Scotland	8,042,000	7,969,000
Northern Ireland	894,600	893,400
Germany	5,712,423	5,679,125
Hungary	1,868,122	1,628,730
Netherlands	689,501	654,251
Estonia	694,700	649,700
Latvia	1,469,570	1,360,460
Lithuania	1,223,600	1,208,420
Bohemia-Moravia		
Protectorate	21,992	25,220
Czecho-Slovakia		
(Jan. 1, 1939)	469,943	485,374
France	9,872,000
U. S. S. R. (Sheep and goats)	102,500,000
Yugoslavia	10,137,357
Sweden	406,000

The 1939 lamb crop in the United States was 31,867,000 head, about 1% under the record crop of 1938.

Sheep slaughtered in the first 11 months of 1939 under Government inspection in the United States numbered 15,852,332, compared to 16,712,714 in the same period in 1938. (See also LIVESTOCK.) (S. O. R.)

Sherman Anti-Trust Act: see LAW (CASE): Anti-Trust.

Shipbuilding. Like shipping, the whole of the world's shipbuilding in 1939 was influenced by war or anticipation of it. The position at the beginning of the year was varied in the different countries but in comparatively few weeks it was on the stable foundation of rational and natural trade. (See also SHIPPING, MERCHANT MARINE.) (F. C. Bo.)

Lloyd's Register for the quarter ended June 30, 1939, the last full quarter reported before the beginning of the European war, showed that there were 719 merchant vessels of 2,859,292 gross tons under construction throughout the world, the number including only vessels of 100 gross tons or more. This compared with 801 merchant vessels of 2,826,902 gross tons under construction at the same period in 1938. Thus the stimulation of building, the extent being an unknown quantity, has occurred in the last half of 1939.

In the United States, where the picture is clearer, the European war gave added impetus to the greatly enlarged merchant marine program which had been inaugurated by the United States Maritime Commission in late 1937 under the provisions of the Merchant Marine Act of 1936, the purpose of which was to continue the policy of providing for the carriage of a substantial portion of American foreign trade in American vessels.

Under this legislation the commission has projected a building

THE NEW "MAURETANIA," completing her maiden voyage Aug. 6, 1939, became the largest liner ever to use the Port of London by squeezing into her dock with only feet to spare

program of 50 ships a year for ten years, at a total cost estimated at between \$1,000,000,000 and \$1,250,000,000. By the close of 1939, the commission had awarded contracts either directly or in co-operation with private owners for 141 seagoing commercial vessels, involving an expenditure of approximately \$350,000,000 and representing almost a third of the full projected program. During the year ended Nov. 1, 1939, the commission or private owners awarded to private shipbuilders contracts for 118 seagoing commercial vessels with a total gross tonnage of 911,455. The enlarged nature of this program may be seen from the fact that the heaviest building year of the American industry between the World War (1914-18) period and the establishment of the Maritime Commission was 1930, when 214,000 gross tons came from the ways, but of the vessels built in that year, only 15 were of seagoing types. At the close of 1939 American shipyards, including the Government-owned Navy Yards, had under construction about

506,600 displacement tons of Government vessels and 1,122,000 gross tons of sea-going commercial vessels, as well as a large number of smaller naval and commercial craft.

The year consequently has been the most active for the shipbuilding industry of the United States since the World War period, when ships were being produced at a rate never equalled before or since in America or any other country.

Wages in American shipyards in 1939 were at their highest level in the history of the American industry and employment was the largest since the World War. Ship repair yards were more active than in recent years and a strong volume of employment was being maintained.

Events of importance in 1939 included the maiden transatlantic voyage of the "S.S. Mauretania," of the Cunard-White Star Line, the largest commercial vessel ever built in England (although not the largest British built vessel), and the launching at the works of the Newport News Shipbuilding and Dry Dock Company of the "S.S. America," the largest commercial vessel ever built in the United States. It is expected that the "America" will be ready for the service of her owners, the United States Lines, in 1940.

Six yards not previously engaged in the construction of ocean-going commercial vessels opened and received contracts in the United States in 1939, two of them being new organizations and the others having been engaged in ship repairing or the building of small vessels. In the field of research, continuing important results have been developed from model tank tests in Europe and America.

It is of note that the most modern and one of the largest model tanks in the world is now under construction at Carderock, Maryland. This model basin will be used for the study and design of ships and their propellers. It will be available for both Government and commercial work. It is nearing completion and will be placed in operation in 1940.

(H. G. S.)

In Britain, the yards which specialized in naval work were busy but the remainder were in a serious condition; the orders placed during the slight revival of shipping in 1937 had been completed and very few had been secured in their place. The effort to spread the benefit of Government work by placing orders for small naval craft with non-naval yards was not yet showing much effect but the high pressure at which the naval section was working had increased costs in all others, both for labour and material, and a number of British orders were going to Continental yards on the difference in price, which in many motor types amounted to from 10% to 17%.

Dutch and Scandinavian yards were working to capacity, very largely on foreign account, as were also the Germans where more of the facilities of the industry were being released for the domestic demand after bitter complaints. A large number of small craft for the coasting trade and inland waterways were being built and experiments with producer gas engines instead of Diesels, in order to reduce the consumption of imported oil, were proving very successful.

The fishing fleet was also in process of expansion with State assistance. In Italy there was still difficulty in getting the huge State-aided program started in full. In both Italy and Germany naval orders provided much employment. The French yards were greatly hampered by the social laws, especially with regard to the short working week, so that naval work was seriously slowed down and the cost of merchant tonnage became prohibitive without heavy subsidy. (See also NAVIES OF THE WORLD.)

In Japan, beside a huge volume of naval work kept carefully secret, the Government policy kept the yards busy on commercial work to the limit of the available material, but after the subsidy policy had encouraged the building of fast liners and tankers almost exclusively, the shortage of tramps became acute and a

program of standardized designs was started.

Alarm about the serious condition into which the British merchant navy had been allowed to decline brought a promise of Government aid, in the form of grants and loans, for the construction of new tonnage, although passenger liners, tankers and refrigerated ships were excluded. A large number of cargo vessels, both steam and motor, were ordered on the first announcement and although the grants were later withdrawn the Government decided to carry on with the loans when the wider subsidy scheme was held up by the outbreak of war.

A small proportion of the ships ordered were designed for regular service but the majority were tramps in the neighbourhood of 9,000 tons deadweight and the number of "handy-sized" tramps was disappointing. Conspicuous favour was shown to the standardized designs which a number of yards had worked out for the sake of economy, and both steam and Diesel machinery was generally of comparatively simple design, few of the more elaborate economizing devices with heavy patent royalties being installed. Except for a few tankers on Norwegian account and still fewer first class tramps for the Greeks there were no foreign contracts and the number of coasters ordered in Britain was not to be compared with the number of contracts which went across to Holland.

When war broke out, and the German submarine campaign was immediately launched against British and French commerce, there was naturally a complete change throughout Europe, in neutral countries as well as the belligerent States, but most of the details were kept carefully secret and only a few were released by ministers and others. Shipbuilding and repairing were brought under strict Government control, for national benefit. In Britain that side was put under Sir Amos Ayre, a practical shipbuilder who had made his reputation with the design and construction of "economy" cargo ships of the simplest and most efficient type, which was the principle most favoured for rapid output and reliability when the engine-room personnel was certain to be of varied quality.

It was soon announced that there was no intention of following the standard ship policy of the World war, when all the yards were made to scrap their individual plans and to work to a few Government designs, and it was planned to secure the most rapid delivery of the simplest suitable types by making the greatest use of the individual policy of each yard and engine works. This policy produced most satisfactory results and there was soon a steady stream of merchant ships being delivered. (See also BLOCKADE; SUBMARINE WARFARE.)

In all the belligerent countries, a large proportion of the shipbuilding resources normally used for mercantile work naturally had to be diverted to naval purposes; in Britain and France because the war against commerce demanded very large numbers of patrol, escorting and minesweeping vessels which were best built at the commercial yards and in Germany because the projected fleet of submarines, especially small minelayers, was far beyond the powers of the few yards which had specialized in their construction before the war.

Italy, Holland and Denmark, with plenty of work on order, were handicapped by the difficulty of getting materials, and Spain, starting a big effort to repair the damage done by the Civil War, of getting machinery and fittings.

Outside Europe, Australia, which had planned a shipbuilding industry for years to go with her increasing steel output, launched it with Government bounties, Japan relaxed her very expensive efforts when the ships formerly on European service returned home and the United States, owing to the workings of the Neutrality Act, were content for the time with the pre-war program of the Maritime Commission.

(F. C. Bo.)

Shipping, Merchant Marine. United States.—The most important development in American shipping since the World War occurred in the fall of 1939 when a special session of Congress, convened by President Roosevelt because of the European war, adopted the Pittman Neutrality Act which barred American ships, American citizens and American seamen from travel to belligerent ports or in combat areas. After a short period of readjustment most of the affected steamship lines found other work for vessels which were thus prohibited from operating in their normal services.

The permanence of these substitute operations and the extent of the hardship which they involved was not immediately ascertainable. (See also NEUTRALITY.)

Leaving out of consideration the neutrality problem which was one of supreme national importance, to be decided on the basis of the welfare of the entire people rather than of the segment represented by the shipping industry, the year 1939 was a relatively successful one for American ship companies and for shipping as a whole.

The American President Lines, Ltd., (reorganized Dollar Steamship Lines) went into full operation with fortnightly sailings in the round-the-world service, and likewise in the transpacific service, spaced so that there was a weekly sailing of American-flag vessels across the Pacific. The Lykes Bros. Steamship Co. lines out of the Gulf were forced to curtail their service during the year because of a decrease in business with Germany, but toward the end of the year resumed their previous activities, using all their ships.

The Government-established American Republics Line from New York to the east coast of South America had a most successful year, and with the increased emphasis on Latin-American trade and co-operation, gave promise of still greater prosperity. The line runs from New York to Rio de Janeiro, Santos, Monte-

video and Buenos Aires. Success of the passenger service inaugurated at the end of 1938 was believed due in part to the speed and attractiveness of the three liners, "Argentina," "Brazil" and "Uruguay," which were luxuriously equipped for the South American trade. The freight service of the Good Neighbor Fleet operated by the American Republics Line also showed encouraging gains.

One new steamship service was established, the Puget Sound-Orient Line, operated for the account of the United States Maritime Commission. This provided cargo sailings from Pacific Northwest ports to the Orient, which had not been available under the American flag since the American Mail Line withdrew its ships in Aug. 1938.

The Puget Sound-Orient Line was begun with cargo vessels on an experimental basis, with the prospect of introducing combination passenger and cargo ships as soon as some now building are completed.

The services to Spanish ports which had been discontinued during the Spanish Civil War were resumed by the American Export Line and Lykes Bros. Steamship Co. This involved merely the addition of Spanish ports of call to the established service. Late in the year the Maritime Commission chartered three of its shipping lines, the American Hampton Roads-Yankee Line, the America France Line and the Oriole Lines to United States Lines company. The lines operated in the transatlantic trade and 16 vessels were covered in the charter. Introduction of new, fast freighters was contemplated for all three lines. American flag trade from the Gulf of Mexico to the Orient practically disappeared because of the difficulty of obtaining cargoes out-bound to China or Japan, but was later resumed.

American steamship lines began to offer substantially improved service with new ships being built under the Maritime Commission's construction program. They provide, particularly, efficient cargo handling equipment, economical operating costs and increased speed. Twenty-five of these had been launched by the middle of October and were to be in service by the close of the year 1939. Several were placed in service on the Moore-McCormack Lines Scantic service to Scandinavian and Baltic ports. The 12 high-speed tankers which were built by the Standard Oil Company of New Jersey, with the Maritime Commission paying the cost of national defence features, including the cost of providing the additional speed above normal tanker requirements, were so successful that three were purchased by the Navy and two by the Keystone Tankship Corporation of Philadelphia. One was placed in service by the Standard Oil company from New York to Aruba, and two in the coastal service.

The "America," largest commercial ship ever built in an American yard, was launched August 31 under the sponsorship of Mrs. Franklin D. Roosevelt.

The commission's construction program was subsequently accelerated so that orders planned for 1940 were in many cases issued in the fall of 1939. By the middle of October, there were 139 ships ordered, of which 25 had been launched.

The C-2 type vessels launched by the commission proved in trials to be among the most efficient of their class in the world. The commission's construction program included a large number of Diesel propelled vessels, marking the first time Diesel propulsion had been given adequate recognition in American shipyards.

Freight rates were steady until the outbreak of the European war when sharp advances occurred due to increased hazards of operation and increased operating costs, such as war risk insurance and the requirement for higher compensation to crews.

GERMAN CREW MEMBERS leaving the burning "Columbus" after the luxury liner was scuttled 450mi. off the U.S. coast Dec. 19, 1939, to avoid capture by a British destroyer

Below, left: AMPLE IDENTIFICATION for submarines was painted on the sides of the U.S. liner "President Roosevelt" before it sailed for Europe Sept. 6, 1939

Below, right: TO AVOID DETECTION BY BRITISH SHIPS, the "Bremen's" crew painted the ship a dull grey during its mysterious voyage from New York to Murmansk to Germany, where it arrived on Dec. 12, 1939

The chartering market was fairly active during the entire year, particularly during the last few months. There was a decided demand for tonnage on time and net form and also on a lump sum basis. Charter prices rose from 300% to 500% and gave promise of rising further if there were continued losses of tonnage from torpedo and mine warfare.

The movement on the Great Lakes was the heaviest in years, due largely to expanded operations of the steel industry. The trade consisted of iron ore from the head of the lakes to Lake Erie and coal on the return voyage, with some carriage of package freight. Coastwise and intercoastal ship traffic was poor during the first half of the year, but improved during the second half. This development was normal.

The Maritime Commission made substantial progress in its training program for licensed and unlicensed seamen, the United States Maritime Service, with the commissioning of the training ship, "American Seaman," and with the establishment of training stations at Hoffman island, New York, Government island in San Francisco bay, and Fort Trumbull, Connecticut.

The European war caught thousands of Americans abroad and passenger facilities on returning ships were insufficient to meet the tremendous demand.

Cots were set up in the public rooms of liners. Freight ships brought passengers far beyond their ordinary capacity. The Maritime Commission arranged the charter of five coastwise vessels for the sole purpose of repatriation.

The demand for space on American ships was increased when the British liner "Athenia" was sunk with many Americans aboard. The Government freighter "City of Flint," operated for the Maritime Commission's account, picked up 221 survivors of the tragedy and made a remarkable voyage to Halifax. With ordinary accommodations for 29 passengers and 40 crew, Capt. J. A. Gainard provided bunks and food for 290 persons.

In the early months of the war American ships and American seamen displayed heroism and seamanship in participating in the rescue of more than 800 persons who were victims of marine disasters resulting from belligerent activity. (See also EXPORTS AND IMPORTS; INTERNATIONAL TRADE; SHIPBUILDING; TRADE AGREEMENTS; UNITED STATES: *History*.) (E. S. L.)

European Shipping and the War.—Merchant shipping for the whole of 1939 was naturally influenced by the war which broke out in September, for in spite of the Munich agreement the world was obviously heading towards war and while all possible efforts were being made to avoid it, every country had to take precautionary measures which involved shipping; all

mercantile plans for the future had to be made with the possibility of war in view.

The war risk added to the expenses of the shipowner and disturbed the marine insurance market long before the war started, especially when huge quantities of gold were sent to the United States in shipments—up to £12,000,000 in one vessel—which were quite unjustified in ordinary commerce, and often in unsuitable ships.

This nervousness of approaching trouble was naturally against the interests of shipping, for the traffic for the purpose of rearmament was purely artificial. Ordinary business enterprise was checked and freights were generally low.

The tramping section was particularly hard hit, for the tendency was to ship in smaller parcels by liner. Practically all owners showed a decline in profit in their reports and had to reduce or pass their dividends.

The International Committee tried to maintain the policy of freight co-operation in spite of obvious signs of crumbling. For a time they had some success, but in consequence of the British Government favouring British ships to carry the war-time reserve of grain from the River Plate when Greeks were next on the agreed roster for employment, the Plate Minimum Freight scheme collapsed and it was realized that international agreement was practically ended until conditions were radically altered. Competition was therefore intensified and matters were made worse by the release of most of the remaining ships' time chartered during the 1937 revival, by the paying off of a number of ships, mostly Scandinavian, which had been employed by the Japanese in the campaign in China and by the collapse of the Government party in the Spanish Civil War.

The possibility of war naturally greatly increased the grave concern already felt in Britain at the decline of the merchant service and seagoing personnel. The shipping industry, through the Chamber of Shipping, issued a very careful statement of the causes of the decline of each section, and suggestions for rectifying matters with the help of the State. The sections which supplied this information were the deep-sea tramps, the deep-sea and near-trade liners, the near Continental traders, the coasting tramps and the coasting liners; the owners of tankers failed to agree among themselves and desired further discussions with the Government.

These reports and suggestions were considered by the authorities who announced the general principles of their plans in March and introduced the British Shipping (Assistance) Bill at the end of July, to come into effect at the beginning of 1940. It provided for a subsidy not exceeding £2,750,000 per annum for deep-sea tramps for five years, and assistance to liners suffering from the competition of subsidized foreign rivals, each case to be considered on its merits.

Tankers and coasters were excluded, the former for lack of suggestion and the latter on account of their competition with the railways. Assistance in the ordering of new tonnage was to be in the form of grants and loans on generous terms, but passenger ships and refrigerated foodstuffs carriers were excluded. The measure was abandoned at the outbreak of war but the shipbuilding sections were honoured as so many ships had been ordered when they were announced in Parliament.

In addition to monetary help the liner and near Continental sections suggested that the fair claims of British shipping should be pressed when trade treaties were being arranged as these had frequently resulted in the shipping of the other country concerned carrying all or nearly all the goods exchanged.

Alongside the move towards State aid the owners and authorities co-operated in measures to keep the ships running in war-time and to defend themselves from attack. The normal sea-going per-

THE FIRST BRITISH MERCHANTMAN sunk in the European war was the "Bosnia," torpedoed Sept. 5, 1939, off the Scottish coast

"YOU HAVEN'T SEEN THE BREMEN AROUND, have you, Bill?" Cartoon by Fitzpatrick of *The St. Louis Post-Dispatch*

sonnel, especially after Royal Naval Reservists had been withdrawn for naval work, would obviously be insufficient when laid-up ships were commissioned and early in 1939 the Mercantile Marine War Services List was established. This was a register of trained seamen of all grades who had left the sea for work ashore and who were willing to return to it. Officers had already gone through the Admiralty's courses on handling their ships in war in large numbers; now the scheme was extended to short courses in gunnery, etc., for the other ranks.

A War Risk Insurance scheme was put into operation by British underwriters in March and although some amendments in detail were immediately necessary it worked well; in April the Government announced its intention of undertaking the re-insurance of the risk.

The sale of British ships, especially tramps, to foreign interests when they could no longer be made to pay under the British flag had also been causing concern and after a period of official discouragement of the practice it was decided that in order to build up a war-time reserve of tonnage, the payment of State aid should be made dependent on owners who had tonnage to sell, giving the Board of Trade the first refusal. When war broke out only four ships had been acquired.

Other countries were also interested in schemes for State aid. In the United States the policy of differential payments, based on the greater building and running costs of American ships as compared with those of practically every other nation, was found to work excellently after weathering a good deal of criticism and it is probable that the nation has got a better return from it than from any previous subsidy scheme. Several of the maritime powers which have previously been against any form of State aid to shipping were being forced to reconsider their position before the outbreak of war, and Germany, Italy and Japan only revealed part of the assistance that was given, since merchant shipping matters are regarded in those countries as being as secret as those of the navy. As part of the reorganization of the American subsidy scheme a number of assisted services have

been offered for sale, but only a few have found purchasers.

In the earlier months of the year there was a strong renewal of the British demand that shipping affairs should be taken out of the hands of the Board of Trade and administered by a Ministry of Shipping concerned with nothing else. This demand was strengthened by the Government action which caused the collapse of the River Plate minimum freights scheme and some incidents concerning the transfer of British ships to foreign flags, but no action was taken until some time after the outbreak of war, when the post of Minister of Shipping was made a political one and nearly all the personnel was drawn from the Board of Trade, with practical shipping men as advisers only.

When the situation became critical British and French liners on yachting cruises were recalled by wireless, mail and passenger sailings were cancelled to satisfy the authorities' demands for auxiliary cruisers, transports and the like, cargo vessels were taken up by the score for war purposes and the plans for utilizing merchant ships in war, although not properly framed until a few months before they were wanted, worked with far less waste and inefficiency than in 1914. All German ships were ordered by wireless to seek shelter at once and special care was taken to get the little short-sea traders into home waters to act as supply ships in the Baltic. The withdrawal of most of the allied passenger liners from the transatlantic service at the height of the American tourist season was particularly awkward and the large number of holiday-makers wanting to get away from Europe was further handicapped by American ships, including some big coastal liners chartered by the U.S. Government, being delayed by disagreement with the seamen as to terms. Some cruising yachts were pressed into service and neutral ships were naturally packed to capacity.

In Britain all shipping came under the control of the Admiralty at once. The Mediterranean was closed to British shipping for a time owing to the uncertainty of Italy's attitude and merchant ships were temporarily held up in neutral ports in areas where there was known to be special danger. The convoy system was started without delay, although at first it was hampered by lack of naval material which forced fast and slow ships to be grouped together and also caused excessive delays. The results were excellent with regard to the safety of the ships; after three months of war 81 British ships of over 305,000 tons gross had been sunk by enemy action, beginning with the "Athenia" on the first day of the war, but of those under convoy the proportion was less than one in 750. The defensive armament of merchant ships was also most effective, although ships so armed were regarded by Germany as warships in spite of all neutral nations acknowledging their rights and Germany herself having done so in the past. (See also SUBMARINE WARFARE.)

There was a great movement to buy shipping shares on the recollection of the profits made during the war of 1914-18, but in British ships freights were strictly regulated from the first, and although the inelastic "Blue Book" system of 1914 was avoided they were soon far below those obtained by neutrals, and running costs naturally rose rapidly. To make the most of the cargo space available a system of licences for all overseas voyages was immediately introduced, worked by voluntary committees of shipping men, and this was later extended to the coasting trade also.

The diversion of a large proportion of the shipping of the British east coast ports to the west as a measure of precaution against air attack caused less confusion than had been anticipated, but there was an inevitable demand on the coasting services to relieve land transport in the distribution of imports and the Dutch motor vessels which had become a big factor in British waters were withdrawn at once although many of them, especially those built for owner-skipper on deferred payment, were soon offered for sale on the insistence of the mortgagee banks.

Although German enemy action by surface raider, submarine and mine caused heavy losses to British, French and Polish shipping, the losses among neutral ships were particularly heavy, especially after the beginning of the German policy of sowing international waters with the new magnetic mine which claimed many neutral ships with heavy loss of life. A number were also torpedoed, both when bound for allied ports and also when on blameless voyages from one neutral port to another. Generally speaking the blockade by German surface ships in the Southern Baltic and the Belts was legal, the ships being sent in to port for search and prize court proceedings, but when a prize crew from the battleship "Deutschland" took the American steamer "City of Flint" into a neutral Norwegian port the United States authorities made a strong protest while the Norwegians released the ship and interned the prize crew. (See also BLOCKADE.)

While a certain number of neutral ships, partly on account of the risk and partly the heavy cost of insurance and manning, were laid up, the majority of them continued to run on a rapidly rising market. The Italian liners "Rex" and "Conte di Savoia" were the only first-line ships to remain on the North Atlantic service and they reaped a rich harvest with increased fares. The "Normandie" and "Queen Mary" were tied up in New York, the "Europa" in Germany and the "Bremen," after finding shelter for some weeks in Russian waters, also returned to a German port.

In spite of the big Government building program that was immediately put in hand, the British merchant navy proved as inadequate for war needs as had been feared for some years past, and a number of neutral ships, mostly Greeks, were taken up on time charter while others were employed on ordinary voyage charter on the open market. The United States Neutrality Act, debarring American ships from a large part of western Europe, threatened the owning firms with immediate destruction of the valuable business that they had built up with so much care and resulted in a number of Scandinavian ships, mostly fast cargo liners, being chartered. (See also BALANCE OF TRADE; EXPORTS AND IMPORTS; INTERNATIONAL TRADE; NEUTRALITY; SPAIN, CIVIL WAR IN; SHIPBUILDING; STRATEGY OF THE EUROPEAN WAR; UNITED STATES.) (F. C. Bo.)

Shock Treatment: see MEDICINE; NERVOUS SYSTEM; PSYCHIATRY.

Shoe Industry. Four months of war in 1939 changed the world economics of shoes and leather—accelerated the use of more heavy shoes and leather and affected world supply and prices materially. The normal eight months of 1939 indicated a rising manufacture of shoes in every country. Intense nationalism found expression in shoemaking and shoe wearing as a symbol of "buy at home."

World Trading.—Leather is actually a "short" world commodity, a by-product of meat and not subject to the theory of "surplus" economics. It therefore commands a world price. The United States is the world's largest producer and consumer of leather and also the largest importer of hides and skins. Normally, a quarter of a million hides and skins are imported every working day of the year into the U.S.—99.9% kidskins, 50% sheepskins, 25% calfskins, 15% cattlehides and 100% kangaroo, lizard, crocodile, shark, etc., for the industry. War has disturbed trade routes and foreign supplies to practically every country on the globe. As a consequence, the supply and price factors are flexible to events on the seas. For example, hides from the Argentine (the world's great supply source) and kid skins from China actually trickle into Germany through neutral countries.

World Production.—World (machine made) production in 1939 exceeded the estimated manufacture of 1938. Machine made

production amounted to 1,183,000,000 in 1939—(Europe, 505,000,000, North America, 515,000,000, South America, 60,000,000, Asia and Oceania, 75,000,000 and Africa, 28,000,000). Native handicraft also increased the world over.

Utilitarian and work shoes increased materially, though the previous trend was towards style and novelty footwear. Regulation and rationing of footwear may accelerate the heavy construction in 1940. Nevertheless, whims of women manifest themselves, and 25,000,000 pairs of elasticized-upper shoes were made in the United States in 1939—which, only three years ago, were an unknown type. In war-free lands the expression of style in men's shoes was significant of masculine dress change.

Rubber Footwear.—Expansion of rubber boot and shoe manufacturing was evident in 1939—war and "decontaminization" civilian wear in Europe; cheap rubber shoes (canvas topped) for peasant and native wear in Asia and Africa; and sport and play shoes (tennis type, sandals, platforms) increased in war free lands.

Controls and Marketing.—World rubber supply is subject to economic rationing by Great Britain; Australian and Indian skins are marketed with British Government controls, Argentine hides are export-managed, and leather is listed as a contraband, by warring nations. Trade barriers, reciprocal agreements and nationalistic controls were revised in late 1939 to include materials in shoe construction but the movement of machinery—mostly from United States—for shoe manufacture is almost universally favoured under regular tariffs. (A. D. AN.)

Shows. Horses.—War in Europe took a noticeable portion of colour and public interest from the principal horse show in the United States in 1939. Only two foreign army teams, those of Mexico and Chile, competed in the eight-day exhibition of the 54th National Horse Show, Nov. 4–11, 1939, at New York. British, French, Irish and Canadian army teams, which had added to the interest in previous shows, were absent in 1939. The 1939 honours were divided among the Mexican, Chilean and United States army teams. Capt. Misael Mariles, Mexico, won the Bowman Challenge Trophy, and his colleague, Capt. Ramiro Palafox, won the Military Special Challenge Trophy donated by Whitney Stone. The Chilean team, composed of Maj. Eduardo Yanez, Capt. Armando Fernandez, Capt. Pelayo Izurieta and Lt. Hernan Vigil, won the three-day, low-score competition for the Arturo Alessandri Trophy. Capts. Fernandez and Izurieta tied for first in the International Individual Military Championship. The United States army team, Capt. Royce A. Drake, Capt. Carl W. A. Raguse, Lt. Franklyn F. Wing and Lt. Frank S. Henry, won the International Perpetual Trophy for military teams. Capt. Drake and Lt. Wing tied for the \$1,000 Military Stake.

The largest prize at the National Horse Show, \$2,000 for three-gaited saddle horses with a natural tail and over 14-2, was won by Clearview Maybelle owned by Mr. and Mrs. Geo. C. Mahoney. This prize, for horses with natural tails, attracted considerable comment by newspapers and the American Society for the Prevention of Cruelty to Animals, at the 1938 show in New York when it was won by Strolling Bye, owned by Mrs. Reed A. Albees. Strolling Bye, which appeared in the 1938 show with a natural tail, was entered in the 1939 show with a set tail.

The American Horse Shows Association, Inc., which has jurisdiction over leading shows in the United States reported 187 recognized shows in 1939 compared to 174 in 1938. The association reported that six shows had resigned membership for 1940. Among these was the Atlantic City, N.J. show, which suspended for lack of public interest. The association's jurisdiction refers chiefly to the larger city and State shows and does not include the small local and county which number several thousand annually in the United States. The association announced re-

ceipts for 1939 as \$14,226; expenses, \$17,708. The deficit of \$3,482 was made up by private contributions. (S. O. R.)

Dogs.—The year 1939 closed with around 302 dog shows. The cocker led in registrations and was the fashionable dog of the day. Other leading breeds in order of registration were the Boston, beagle, Scottish terrier, wire-haired fox-terrier, Pekingese, dachshund, springer, chow chow and greyhound. The largest show of the year was the Morris and Essex at Madison, N.J., with 3,862 dogs actually on the benches. (W. Ju.)

Livestock.—Heading the list of national livestock shows for 1939 was the 40th International Livestock Exposition and Horse show which was held from December 2 to 9 in the International Amphitheatre at the Chicago stock yards. Stockmen from 34 States and Canada exhibited 13,322 head of beef cattle, horses, sheep and swine. The 33rd National Western Stock show, first in calendar position among American national shows, was held in Denver, Colo. January 27 to February 4. It is noted for its exhibitions of feeder cattle and beef bulls which are shown, judged and sold in carlots.

Another early show, and the oldest in the United States, is the Southwestern Exposition and Fat Stock show at Ft. Worth, Texas. It celebrated its 43rd annual renewal March 10 to 19, 1939. The Eastern States Exposition at Springfield, Mass., a late summer show founded in 1917, accents dairy and beef cattle competitions. It was held September 17 to 23. A similar exposition in the West is the Pacific International at Portland, Oregon. It was founded in 1911 and was held Oct. 7 to 14, 1939.

A series of national shows, featuring, in turn, beef cattle, horses, swine, sheep and dairy cattle, was held during 1939 in connection with the Golden Gate International Exposition at San Francisco. Cash prizes totalling \$266,980 were offered in the five divisions which took place at intervals from February 18 to October 30. The final feature was the National Dairy show, which was founded in Chicago in 1906 and in later years became an itinerant show. Its San Francisco dates were October 21 to 30. Dairy men and Belgian draft horse breeders stage a combined show each year at Waterloo, Iowa, known as the Dairy Cattle Congress and National Belgian Horse show. The 30th Congress was held September 25 to October 1. The American Royal at Kansas City, Mo., is noted for its outstanding horse shows and beef cattle exhibitions. The 40th Royal was held October 14 to 21. Important livestock shows were also featured at nearly all of the State fairs during the summer and early fall months.

Canada's two leading annual livestock shows are the Canadian National Exposition and the Royal Agricultural Winter Fair, both of which are held in Toronto. The Canadian National, founded in 1879, was held August 25 to September 9. The 18th Royal Winter Fair was scheduled for November 21 to 29 but was cancelled on account of the war. The big livestock exposition of South America is the Palermo show, held annually in Buenos Aires in August. It usually runs about ten days, no definite closing date being scheduled. The Palermo show is particularly noted for its huge showing of Shorthorn cattle, attracting each year the largest display of this breed in the world.

Great Britain's two leading all-breed shows are the long-established Highland show of Scotland and the Royal of England. Both are itinerant. The 108th Highland show was held in Edinburgh June 20 to 23; and the 98th annual Royal show took place in Windsor July 4 to 8. (W. E. O.)

Siam (Thailand). Area 200,148 sq.mi.; pop. (census 1937) 14,650,000. Chief towns: (pop. 1937) Bangkok (cap. 681,214); Chiangmai (544,001); Khonkaen (473,475); Chiangrai (443,476). Ruler: King Ananda Mahidol; language: Siamese; religion: Buddhism.

PRINCE ADITYA DIRABHA, regent of Siam, affixing the royal seal on a decree which officially changed the name of the kingdom to Thailand on June 24, 1939.

History.—Siam, which at the end of May announced her change of name to "Muang Thai" ("The Land of the Free"), continued to maintain her neutral independence during 1939 and, in face of the European war, proclaimed her strict neutrality within three weeks of its outbreak, and proceeded with her land, sea and air rearmament. A plot revealed in January for the replacement of the young King Ananda Mahidol by the former King Prajadhipok (now Prince Sukhodaya), or by another uncle, Prince Nago Svarga, and the consequent cashiering of a number of army officers, had no effect on the peaceful progress of the country, the development of which is proceeding on well thought out lines, especially in road-construction and irrigation. Though the capital, Bangkok, now one of the most important air-route centres in Asia, suffered through a serious fire in August, damage estimated at over £90,000, progress has been made with its new port; and by encouraging the co-operative credit movement and issuing an internal loan of 25,000,000 baht the Government has done much to improve the lot of the peasants.

Following the treaties successfully concluded with various foreign powers in 1938, a number of new laws affecting trade were passed, and the sale and manufacture of oil (the refining of which is a Government monopoly), salt and tobacco are now controlled. Large changes in the finances were made during 1939; the capitulation tax and taxes on sugar-cane and tobacco plantations with other land-taxes and those on houses and shops were replaced by a re-organization of excise duties and other special revenue, the balance being slightly against the treasury. Also, the beginning of the financial year was changed from April 1 to October 1.

(L. H. D.)

Education.—In 1936-37: elementary schools 8,983; scholars 1,151,915; secondary schools 206; scholars 42,225; special schools 2,984; scholars 33,087; universities, number of students enrolled 11,525.

Banking and Finance.—Revenue, ordinary (est. 1939-40) 109,425,940 baht; expenditure, ordinary (est. 1939-40) 109,397,988 baht; expenditure, capital (est. 1939-40) 22,108,524 baht; public debt (Mar. 31, 1938) 80,593,000 baht; notes in circulation (June 30, 1939) 151,000,000 baht; exchange reserve (June 30, 1939) 127,000,000 baht; gold reserve (June 30, 1939) 18,000,000

baht: exchange rate (approx.) 11 baht=£1 sterling.

Trade and Communication.—Foreign trade 1938-39; (merchandise): imports 123,575,000 baht; exports 173,078,000 baht. Communications: roads, State highways completed (1938) 1,815 mi.; railways, open to traffic (1938) 1,925 mi.; airways, length of route opened (1938) 444 mi.; motor vehicles licensed (1937-38): total 11,439 (cars 5,910; trucks 4,233; buses 146; cycles 559); wireless receiving set licences (1938) 29,834.

Agriculture and Mineral Production.—Production: (in metric tons), rice (1938) 4,937,400; rubber (1938, exports) 42,000; tin ore, metal content (1938) 14,000; soybeans (1937) 9,721; tobacco (1937) 8,033; cotton (1937) 7,083; maize (1937) 5,025.

Siberia: see UNION OF SOVIET SOCIALIST REPUBLICS.

Siegfried Line. Germany's Siegfried Line or "Westwall" is that nation's answer to France's eastern border fortifications, the main elements of which were completed in 1934 to bear the name of the Minister of War during whose regime they were commenced—André Maginot.

Begun in 1937, Hitler (May 1938) pronounced the Siegfried works "the most gigantic fortress in the world," embodying, in the advanced zone, no less than 17,000 concrete forts, these supported in rear by from three to four additional lines of defence. Completion of the whole by the winter of 1937-38 was predicted, but it is recorded that when the Fuehrer visited Kehl in Sept. 1938, to inspect the progress thus far made, he nearly wept with disappointment. Roundly castigating the Prussian officers who accompanied him, he summoned Germany's ace roadbuilder, Dr. Fritz Todt, and instructed him in no uncertain terms to increase without delay the tempo of the entire effort. Within a brief space thereafter, 500,000 additional workmen had been assembled for assignment to the task, and shortly some 278,000 of these were pouring concrete at scattered points along the line.

Following quite closely the windings of Germany's western frontier from Switzerland (opposite Basel) to a point facing the Dutch border approximately 60 mi. north of Aachen, the key points in the Westwall include the rebuilt Isten fortress opposite Mulhouse, the fortifications around Kehl (just east of Strasbourg), the Saar forts, and the defences of Cologne. In the Kehl sector especially, observers report "pillboxes" so numerous that they appear to be located no more than 100 m. apart: indeed the number of these strong points along the entire 150 km. where the Rhine forms the international boundary is notably greater on the German than on the French side. And while the French have placed their works, in general, from 7 to 10 km. distant from the boundary proper, the German emplacements, when not actually contiguous to it, are usually not far removed.

While the measures taken on the German side to delay and nullify tank attacks are similar in scope to those employed by the French, they differ in certain details. Thus, although barbed wire entanglements are common to both, as are blind ditches and other terrain obstructions, the Germans rely on thousands upon thousands of small pyramids of concrete, projecting to unequal heights from the surface of the ground, to bring grief to mechanized vehicles, whereas the French favour the installation, in comparable positions, of equal numbers of steel rails set vertically in the earth, again with their free extremities rising for varying distances above the sod. It likewise appears that, while employing, in part, underground beehives similar to those of the French, they have not burrowed so deeply nor built as massively as have their enemies. Thus a German artist's sketch of one of their blockhouses reveals but three levels (as against seven in a comparable unit of the Maginot line). The uppermost of these is no more than a small

cupola set atop a lower one of materially greater dimensions, the floor of which is at ground level. The single subsurface gallery depicted houses the inevitable electric tramway for communication with other strong points, and with the rear.

The roof of the crowning cupola (which houses personnel engaged in observation and communications) appears to be three or more feet thick, while that of the huge mushroomlike edifice beneath, the west-facing elements of which contain guns and their crews, the remainder, quarters and utilities for officers and men, seem fully as thick again. Even a density of six feet, however, is only just sufficient to protect against a shell of 250 mm. calibre, so it is evident that these works are not designed to withstand the fire of guns of over 10" bore. But being as they are, so numerous, and so relatively small by comparison with many of the French underground fortresses, it may be assumed that the Germans have concluded (probably wisely) that no enemy would waste the effort of super powerful artillery upon any one of them.

The scope of these fortifications has been described in the German publication, *Der Angriff*, as follows: "There is a front line of steel and concrete pyramids running like a road over hills and down valleys from the northern to the southern extremity of the Western Border." Behind this lies . . . "a secondary line of ferro-concrete forts largely sunk into the ground and practically invisible to the naked eye." Reports indicate that behind the works just described lie chain after chain of machine gun nests. These are not, however, necessarily interconnected by networks of subterranean passages, for the German high command does not favour an entirely underground system as do the French. Rather does it share its favours between works above ground, but very heavily camouflaged, and those below, restricting these, however, as already indicated, in both size and scope.

Closely linked with, and parallel to, the Westwall defence system is an "Air Defence Zone"—separated from it by distances varying from one to several kilometres, then extending eastward to a depth generally greater than that of the Westwall itself. Here lie myriads of anti-aircraft gun positions, deeply echeloned and, like the front lines, heavily camouflaged. Supplementing these are kite and balloon barrages, so-called "mine fields of the air." The entire zone is covered with a network of observation posts, with telephone connections, prepared to notify neighbouring anti-aircraft batteries and the headquarters of fast pursuit squadrons of the approach of hostile planes.

Not only is anti-aircraft defence provided (and this is flexible, as well as stable since, in addition to permanent emplacements, many motorized field batteries are available) but, if we can give credence to an article in *Die Wehrmacht* (Feb. 1, 1939) by Lieut. General Kitzinger, zone commander, the area appears literally to constitute a second Siegfried Line. He says in substance: "All parts of the Western Air Defence Zone are protected by armour and reinforced concrete. An enemy attacking this terrain strikes, after penetrating the army zone (Westwall), tank obstacles, road obstructions, and a united front of ground defences which at several points are echeloned to a depth of several kilometres. . . . The zone as developed is a powerful element in the framework of West Front defence. The ground works are of great depth, while in the air is a blockade stronger and more extensive than any has ever been. The countless anti-aircraft batteries and pursuit squadrons protect not only the operations zone of the army; they are above all an effective defence for the populace and industry of great areas of our land." (See also EUROPEAN WAR; LIGHTNING WAR; MAGINOT LINE; STRATEGY OF THE EUROPEAN WAR; TACTICS IN THE EUROPEAN WAR.)

Sierra Leone: see BRITISH WEST AFRICA.

Silk and Silk Manufacture. The economic history of the silk industry for 1939 is replete with contradictory and illogical situations. In a year when new synthetic fibres designed to compete with silk were brought to more practical development, silk prices soared to levels higher than for ten years. The rising trend in consumption during the last six months of 1938 reversed itself in 1939 as a decrease of 7% in the year's consumption.

The first four months of 1939 showed an average price on the New York market of \$2.14 a pound. The 1938 yearly average was \$1.69. The rise began in May and moved rapidly upward closing in December at \$4.34 a pound. Average silk prices during 1939 were 60% above the 1938 level. The cause of the unexpected and unexplainable rise is not clearly indicated. A shortage in supply would partially account for it, but not to the extent of the 60%. The general belief was that speculation in the Japanese market got beyond control of the Government as it did about 20 years ago when the American silk market became so alarmed by severe fluctuations in the price of their raw material that special business missions went to Japan to discuss the situation with high officials. At that time, the fabric manufacturers were the sufferers, and through their trade association in the United States special statistical information was collected and disseminated as to actual stocks of silk in New York warehouses, prices quoted on the Yokohama Bourse and on the outside markets so as to dispel some of the uncertainty among American consumers as to what they might expect in price changes. For several years, prices were fairly well stabilized, and it was believed that a similar situation would not repeat itself. In 1939, it was the hosiery manufacturers in the United States who were chiefly affected. Prices in women's hosiery increased at the end of 1939 about 8% and plans were being made to utilize rayon to a greater extent than before. This did not take into consideration the plans for use of nylon, which had already appeared on sale in one American city in women's hosiery and which it was expected would be available in the late spring of 1940 for general distribution.

Silk supplies, as predicted in the 1938 report, were small at the close of 1939. Japan's internal problems of labour shortage, coal and power restrictions plus rain, frost and disease in Italy and the continued warfare in China combined to generally contract production. Japan, too, radically increased its domestic consumption of silk. At the beginning of 1940 prices were going down in New York but reports were that the silk price trend was still strong in Japan because of fears of possible shortage in New York and a belief that a further rise in world commodity prices was inevitable. At the same time, hosiery manufacturers predicted a 50% decrease in the use of silk in 1940. New fine denier, high strength rayons with nylon and vinyon would be supplemented by cotton lisle and cuprammonium rayon in toes, heels and tops of medium and lower grade stockings. This would mean a loss of possibly \$75,000,000 to Japan, a serious blow to its gold credit in the United States. The increased silk prices meant greater accentuation of the elimination of silk in fabric manufacturing. At the close of 1939, fabric mills in the U.S. were said to be consuming only 9% of the total imports. In Europe and Great Britain the consumption of silk showed slight change but, contrary to conditions in the U.S., both the United Kingdom and Switzerland showed, during the major part (first seven months) of 1939 an increased importation of 1% and 7% respectively. In France, the increase was much larger, 54%. This is principally because of the manufacture of war materials but also possibly influenced by an increased use of silk as a substitute for wool in clothing. (See also RAYON.)

(I. L. BL.)

SILVER PRODUCTION: world total and output of the major producing countries, as compiled by *The Mineral Industry*

Silver. The world's silver production is rather heavily centred in North America; this continent in 1929 furnished 75% of the total output, and 64% in 1938; Mexico is the leading producer, with 30%, followed by the United States with 23%, Canada with 8% and the remainder of the continent (including Central America, West Indies and Newfoundland) 2%. The status of the important producers is shown in the accompanying graph and table.

Figures for the first 10 months of 1939, although not quite complete, indicate a decrease in output of about 5% from the same period in 1938.

The chief decreases are in Mexico and the United States, partly offset by minor increases in other countries.

On July 1, 1939, the official U.S. Treasury price for newly mined domestic silver was raised from 64.64 cents to 71.11 cents. The London market for sterling silver opened at 21.125d., and closed at 22.5d., with a high of 23.5d. and a low of 16.0625d. The New York open market stood steady at 42.75 cents till late in June, but fluctuated considerably during the second half of the year, with a high of 39.75 and a low of 34.25 cents, closing at 34.75 cents.

British production of silver is comparatively small; the United Kingdom itself has only a negligible output, and Empire production centres chiefly in Canada, Australia, Burma and South Africa.

Empire production as a whole is still slightly under the 1929 level in ounces, but by less than the change in world output, so that the proportion of the world total in 1938 was 18% against 16% in 1929. (See also METALLURGY; MINERAL AND METAL PRICES AND PRODUCTION.)

(G. A. Ro.)

Simpson, James (1874-1939), U.S. business executive, was born January 26 at Glasgow, Scotland and emigrated to the United States as a boy. He began his business career as a clerk with Marshall Field & Co., Chicago department store, in 1891, advanced to president in 1923 and was made chairman of the board in 1930. From this position he resigned in 1932. He was also chairman of the board and a director of Commonwealth Edison Co., Public Service Co. of Northern Illinois and other utilities, and was prominent in many civic enterprises. He died November 25 at Chicago.

Singapore, the capital of the Straits Settlements (*q.v.*) and main port of south-eastern Asia, is located on an island, of the same name, 27mi. long and 14 broad, area 225 sq.mi., at the tip of the Malay peninsula. It is situated at 1°20' north. The population of Singapore island (June 30, 1938) was 710,057. Singapore is the greatest British naval base in the Far East and its land and air defences have been considerably strengthened during recent years. Its garrison consists of about 7,000 men and the Royal Air Force maintains at Singapore two bomber and two reconnaissance squadrons. (W. H. CH.)

Sin Kiang (CHINESE TURKESTAN), area 705,769 sq.mi., population 4,360,020 (estimate of the Chinese Ministry of Information, 1936), is one of the largest, most remote and sparsely populated sections of China. A large part of this vast territory consists of desert, which accounts for the scanty population. The principal towns are Kashgar (80,000), Yarkand (75,000) in the south-west, and Urumtsi (50,000) in the north. The latter is the seat of the Chinese Administration. The chairman of the Provincial Government is Li Yung. Sin Kiang is not an integral part of China and is largely inhabited by peoples of Turki and Mongolian stock. Most of the province is under the control of the Chinese Administration, which is under strong Soviet influence; but some of the southern districts remain in the hands of the insurgents. (W. H. CH.)

Slate. The leading slate producers, in order of importance, are the United States, United Kingdom, France and Germany; the Soviet Union, India, Belgium, Sweden, Australia and Canada account for possibly 10% of the output, and the four leaders the remainder. The United States output, which ranks first, was 492,690 short tons in 1938, a small increase over 1937, but still 37% below the pre-depression high. About 71% of the output was sold as granules and flour, 24% as roofing slate, 5% as structural and sanitary slabs, flagstones, blackboards, electrical switchboards and insulation, grave vaults, school slates and billiard table tops. The industry in the U.S. is practically self-contained, exports and imports being negligible. British and French productions have been declining since 1935, while the German output has been increasing. (G. A. Ro.)

Slawek, Walery (1879-1939), Polish statesman, was born on April 2. As a youth he became preoccupied with the misfortunes of Poland. Before the World War he was a leader of the Polish Socialist party and took part in the Pilsudski revolution of 1905. He was Pilsudski's most intimate friend and political adviser and formed the famous "Colonel's Group" which supported the marshal after his seizure of dictatorial power in 1926. Slawek entered the Polish Sejm in 1928 and

was later appointed premier. He resigned, however, to permit Pilsudski to become premier and thus strengthen the dictatorship. He became premier again in 1931 and held the post for a third time from March to Oct. 1935. He was often called the "spiritual father" of the new constitution which came into force shortly before Pilsudski's death in 1935. After assuring its operation, Slawek again retired and disbanded the bloc which had supported the dictatorship. Slawek shot himself on his 60th birthday and died at Warsaw the next day, April 3.

Sleeping Sickness: see BRITISH WEST AFRICA; HORSES; VETERINARY MEDICINE.

Slovakia. Slovakia, a republic in Central Europe, bounded on the N., W., and S. by Germany, on the E. and S. by Hungary, has an area of 14,848 sq.mi. with a population of 2,773,000, of whom the great majority are Slovaks, a Slav people closely akin to the Czechs. Their most important minorities are the Germans with about 100,000, and the Hungarians with about 70,000 people. The capital is Bratislava (Pressburg) with a population of 125,000.

Slovakia formed a part of Hungary before the World War (1914-18). In 1918 Slovakia became a part of the new republic of Czechoslovakia. Subsequent to the pact of Munich in the fall of 1938 Slovakia lost part of its territory to Hungary, but was constituted as an autonomous province within Czecho-Slovakia. Under the leadership of Mgr. Josef Tiso, Slovakia organized a semi-Fascist regime, introducing much of National Socialist legislation, pursuing a strictly anti-Semitic course, but relying on the support of the Catholic Church to which the large majority of the population belongs. The party in power was the Slovak People's Party founded by Father Andreus Hlinka. Some extremist members of the party tried to establish with the help of Germany the complete independence of Slovakia and to cut all ties with the Czechs. Leaders of this section were Dr. Bela Tuka, Sano Mach and Dr. Ferdinand Durcansky. With the support of Germany they succeeded in overcoming Czech resistance; their movement of independence gave the signal for the final dissolution of Czecho-Slovakia (*q.v.*). The Slovak diet met on March 14 and proclaimed Slovakia as an independent republic. Reverend Tiso was elected prime minister, Dr. Tuka, vice-premier and Dr. Durcansky, foreign minister. The new Government signed a treaty with Germany according to which Germany undertook to protect the political independence and territorial integrity for a period of 25 years. German armed forces received the right at all times to erect military plants in certain parts of Slovakia and to maintain there military establishments at a strength deemed necessary by Germany. The Slovak Government pledged itself to organize its own army in close co-operation with Germany and to conduct always its own policy in such a way as to correspond to the spirit of the treaty. Thus Slovakia, although nominally independent, was established as a German protectorate. A new constitution was adopted on July 21. On October 26 Reverend Tiso was elected first president of the republic. Dr. Tuka, the leader of the pro-Nazi extremists, became prime minister. The new State shows on its coat of arms three mountain peaks in light blue on red ground, the central peak crowned with the double cross of SS. Cyril and Methodius. Its flag consists of even stripes in white, light blue and red.

The war between Germany and Poland involved also Slovakia. A military agreement between Germany and Slovakia put, on August 18, the whole Slovak Army at the German disposal. The German Army made Slovakia's border with Poland one of the important starting points for the occupation of Poland. By the German victory over Poland Slovakia regained a small slice of

territory with about 9,000 inhabitants which she had ceded to Poland in the fall of 1938. The strong German influence in Slovakia aroused the opposition of some Slovak circles, among them of Dr. Karel Sidor, who was afterwards named Slovak minister to the Vatican. The economic situation of Slovakia was most difficult in the first months. Slovakia is a rather poor and backward country where the progress achieved during the last 20 years had been largely made possible by the financial strength and the progressive economic system of the western parts of Czechoslovakia. Independent Slovakia suffered from a lack of raw materials and by an unfavourable trade balance. The war which broke out in Sept. 1939 aggravated the economic situation in Slovakia as it did in all parts connected with the German economic system. (H. Ko.)

Slow-Down Strikes: see DETROIT; LABOUR UNIONS; UNITED STATES: *Strikes*.

Smigly-Rydz, Edward (1886–), Polish statesman and soldier. An orphan at the age of nine, he studied painting and philosophy in his youth at Cracow, where he first met Josef Pilsudski. During the first three years of the World War (1914–18) he fought against Russia on the eastern front as a battalion and regimental commander in Pilsudski's legions. He also served throughout the Russo-Polish war of 1919–20 and commanded the troops that captured Kiev. From 1922 to 1935, always one of Pilsudski's most intimate associates, he was inspector of the Polish army. After the death of Pilsudski in 1935 he became virtual dictator of Poland. He immediately succeeded the latter in leadership of the army (as inspector-general) and in July 1936 he was proclaimed the leading citizen of Poland after President Moscicki (*q.v.*). Just before the German invasion of Poland Marshal Smigly-Rydz was designated commander-in-chief of the army and successor to Pres. Moscicki. Less than three weeks after the war began Smigly-Rydz fled across the border to Rumania, where he was interned.

Smith College. The resignation of William Allan Neilson, who had been president of Smith college since 1917, took effect in July 1939. Mrs. Dwight M. Morrow of the college's board of trustees was appointed temporarily as acting president, and in October, Herbert John Davis, professor of English at Cornell university, was appointed fourth president of Smith, to take office in 1940–41. For the first time since its establishment in 1925, the Junior Year Abroad was cancelled because of the European war. In the autumn of 1939 a new field house was completed. Enrolment at the college for the academic year 1939–40 was 2,077 students; the faculty numbered 238, and the number of volumes in the library was increased to 266,964. The endowment in 1939 was \$6,129,902.

Smithsonian Institution, founded 1846 by bequest of James Smithson of England, "for the increase and diffusion of knowledge among men." Governing body, board of regents. Executive officer, Dr. Charles Greeley Abbot, secretary. Directs six Government bureaus; also Freer Gallery of Art and Division of Radiation and Organisms.

Activities in 1939.—*Smithsonian*: Smithsonian Gallery of Art Commission, set up by Congress, held competition for design for proposed Smithsonian Gallery of Art building, and awarded prize for best design to Eliel Saarinen; completed third year of weekly educational radio broadcasts, "The World is Yours," in co-operation with U.S. Office of Education and National Broadcasting company; established retirement system for employees paid from Smithsonian private funds; publications issued (Smithsonian

and all its branches), 99; distributed, 162,030 copies. *National Museum*: Specimens added to collection, 368,082; numerous scientific expeditions in the field; 14 special exhibitions held; visitors, 2,233,345; publications issued, 35; distributed, 69,658 copies. *National Gallery of Art*: Gallery established by joint resolution of Congress. Art works and building to contain them gift to nation by the late Andrew W. Mellon. Gallery designated as bureau of Institution, but administered by board of nine trustees; David K. E. Bruce, president; David E. Finley, director. At close of fiscal year, superstructure of building completed; expected building will be completed Sept. 1940; estimated cost, \$15,000,000; received from Samuel H. Kress and Samuel H. Kress Foundation Italian paintings and sculpture said to be one of finest private collections of Italian art in the world. *National Collection of Fine Arts*: This name designates art collections administered by Smithsonian Institution. Six special exhibitions held; 18th annual meeting of Smithsonian Art Commission (formerly National Gallery of Art Commission), held Dec. 6, 1938. *Freer Gallery of Art*: Added to collections bronze, jade, manuscript, and paintings from China, India, and Egypt. Visitors, 102,936. *Bureau of American Ethnology*: M. W. Stirling, chief, directed expedition, in co-operation with National Geographic Society, to Veracruz, Mexico, where 9 stone monuments, including one with initial-series date, were discovered. Other field work on American Indians conducted by the following members of scientific staff: Dr. J. R. Swanton, Dr. F. H. H. Roberts, Jr., Dr. J. H. Steward; linguistic studies conducted by Dr. J. P. Harrington; Henry B. Collins, Jr., and Dr. William N. Fenton added to staff; publications issued, 6; distributed, 19,527 copies. *International Exchange Service*: Official agency for United States for interchange with other countries of governmental and scientific documents; packages of such material handled during year, 714,877; weight, 719,694 pounds. *National Zoological Park*: Added to collection large number of animals, birds, reptiles, and amphibians brought back by the director from the Argentine; total number of animals in collection, 2,450; visitors, 2,201,080; \$90,000 allotted by Public Works Administration for new restaurant building. *Astrophysical Observatory*: Maintained solar observing stations at Mt. Montezuma, Chile, and Table mountain, Calif.; began observations of solar constant at station recently established on Burro mountain, Tyrone, N. Mex.; at Mt. Wilson, Calif., observatory measured distribution of energy in spectrum of brighter stars using 100-in. telescope and apparatus specially developed for this purpose; recomputed all solar-constant values since 1923. *Division of Radiation and Organisms*: Carried on investigations in the field of radiation in relation to plant growth, especially photosynthesis. factors influencing plant growth, and stimulative action of ultra-violet radiation; published 3 papers. (C. G. A.)

Smuts, Jan Christiaan (1870–), South African statesman and soldier, was born May 24 near Riebeeck West in Cape Colony. Educated at Cambridge, he was admitted to the Cape Town bar in 1895.

He fought with the Boer field forces and was commander-in-chief of the rebel forces in the Cape. After the war he became a loyal supporter of Gen. Louis Botha's policy of conciliation and co-operation with the British. For his later career as prime minister, see *Encyclopædia Britannica*, vol. 20, pp. 845–6. After 1924 Gen. Smuts was comparatively inactive in South African politics. He was Rhodes Memorial lecturer at Oxford in 1929–30 and rector of St. Andrews university from 1931 to 1934. Britain's declaration of war against Germany Sept. 3, 1939, brought him back as prime minister after Hertzog had resigned. On September 6 he formed a war cabinet, and the Union proclaimed a state of war with Germany.

Snelling, Charles Mercer (1862-1939), American educator and mathematician, was born November 3 at Richmond, Va. After graduating from the Virginia Military Institute in 1884, he taught mathematics in various southern schools and in 1888 joined the faculty of the University of Georgia, of which he was acting chancellor in 1925-26 and chancellor from 1926 to 1932. He died September 19 at Athens, Ga.

Snijders, Cornelis Jacobus (1852-1939), Dutch general and commander-in-chief of The Netherlands' armed forces during the World War, was born at Nieuwe Tonge on September 29. At the age of 20 he was appointed second lieutenant in the Dutch Army and was promoted through the ranks to general, five days after German troops crossed the Belgian frontier in 1914. Though The Netherlands maintained neutrality throughout the war, Snijders kept its army of 450,000 men completely mobilized until 1918. He was raised to commander-in-chief of the army and navy, the first time this rank had been awarded since the 18th century. After the war the Dutch Socialist party succeeded in securing his dismissal and he devoted his time thereafter to civil aviation. He was largely instrumental in the establishment of The Netherlands' direct air route to the East Indies. Gen. Snijders died at Hilversum on May 26.

Soap, Perfumery and Cosmetics. Despite the further spread of war in Europe, the two most important developments in these industries in the United States during 1939 were both of a legal or governmental nature. With barely 30 hours' grace the President signed the Lea bill, postponing the Federal Food, Drug and Cosmetics Act's effective date from June 24, 1939 to Jan. 1, 1940. The task of repackaging and relabelling so many of the products of these three large industries on short notice and at an arbitrary date line would probably have taxed the printing and container manufacturing plant of the U.S. beyond capacity, exposing producers of the industries affected to unnecessary prosecution for their inability to comply on time as well as to serious and irrelevant financial loss. Postponement was not otherwise desirable. Instead of one period—in May and early June—there were two—the second in November and December—when trade in the industries was definitely depressed by distributors' unwillingness to make commitments pending the date of the act's effectiveness. A significant point about this new law for the consumer to remember is that, presumably, it can affect only goods sold in interstate commerce. Outside those States which enact parallel laws, then, a manufacturer doing only an intrastate business may ignore the Federal act's requirements, many of which—notably those touching the certification of colouring materials, the identification of manufacturers on their labels, and the elimination of deceptively sized and designed containers—are eminently desirable both to consumers and reputable producers. Further, it is already evident that as with all such laws, enforcement will be easy with established, responsible manufacturers, difficult where irresponsibles and fly-by-nights are involved.

The second event of major importance was the amendment of the law levying excise tax on perfumery and cosmetics. It is generally accepted that, by definition, an excise tax is imposed only on the product itself. For example, the excise tax on a 50gal. drum of alcohol is on the alcohol alone; not on the drum, nor on the multitudinous additional charges that enter into the total price charged by the producer. Yet, with respect to cosmetics and perfumes the Federal Government has consistently ruled that the excise tax must be assessed on the producer's selling price. Un-

fortunately the amended law is so ineptly phrased that considerable doubt still persists as to exactly how much relief it will afford the industries concerned.

The status of these three industries in the European countries involved in war is uncertain. The use of cosmetics has been discouraged in Germany for many months. In Great Britain the consumption at least of moderately priced products had not been seriously curtailed in 1939. Inevitably in those countries where the supply of edible fats is a problem, the soap industry must be adversely affected. (H. T.)

Soccer. Soccer made considerable headway in the United States during 1939 by virtue of a visit by the Scottish All-Stars. Appearing twice at the Polo Grounds, in New York, the Scots were held to a 1-1 tie in the first game against a picked eleven representing the American Soccer League, under the auspices of the U.S. Football Association. In a return match, during an extra period, the famous tourists defeated the League team 4-2, winning the National (Open) Championship, in a match that was considered the best showing ever made by representative American soccer players against Scotch opponents.

In the National Challenge Cup competition of the Association, 64 teams played excellent ball, the winners of the national championship being the St. Mary's Celtics, of Brooklyn, vanquishing the Manhattan Beer Soccer Club, of Chicago, during a home-and-home series. St. Michael's A.C. Team of Fall River, Mass., won the national amateur championship during a contest that attracted 117 teams, defeating the Galletin S.C. in the finals. The Avella Polar Star Juniors won the national junior championship from the Apache Juniors.

In the professional circuit of the League, the Brookhattan S.C. were the American division winners, and the Scots American S.C. won in the national division. (J. B. P.)

Socialism. The year 1939 witnessed little change in Socialist alignment in the United States. The National Executive Committee of the Socialist party, in its meeting in Milwaukee on December 10 and 11, in looking forward to the 1940 campaign, recommended to the Socialist party National Convention "the nomination of a presidential ticket and an aggressive campaign in 1940 unless, as a result of inquiries initiated by the N.E.C., it develops that there is serious interest in, and support for, an independent farmer-labour campaign with which Socialists can consistently co-operate." The committee voted "full moral, financial and material support to the Finnish workers and farmers and their people's army."

In a previous session, the N.E.C. reaffirmed the party's anti-war stand and urged that the United States remain at peace. With the development of the European war crisis, the two committees appointed by the Socialist party and the Social Democratic Federation to discuss the question of unity suspended negotiations. The Social Democratic Federation N.E.C. declared in favour of the running of a third party candidate should the Democratic party fail to nominate a progressive.

In the municipal elections during the year, Jasper McLevy, Socialist Mayor of Bridgeport, Conn. (member of the S.D.F.) was re-elected. Harry W. Laidler was elected one of the two American Labor party councilmen in New York city.

In Canada, that country's Socialist party—the Co-operative Commonwealth Federation—adopted a war policy at its fall conference, which, in summary, favoured (1) adequate defence of Canada's shores (2) material aid to the Allied powers; and (3) preservation of civil liberties at home. The conference, on the other hand, opposed conscription of man power and the sending of an expeditionary force abroad.

In Europe, the Socialist movement was compelled increasingly during the year to concentrate its attention on the war crisis.

When Great Britain declared war, the National Executive committee of the British Labour party threw its support to the war, and agreed to the suspension of by-elections maintaining, at the same time, its independence from the Government and its right of criticism. The party declared that it would "use all its authority to build a peace of justice which removes the causes out of which war comes." It denounced the Government's refusal to take action on demands for the extension of self-government of the British States of India and urged a capital levy of 1% and measures to safeguard labour. The Independent Labour party opposed Britain's entrance into the war and the system of conscription, as did George Lansbury and some other members of British Labour. The New Fabian Research Bureau during the year merged with the Fabian Society.

The French Socialist party in September likewise voted its support of the war. It opposed attempts to suspend parliamentary activity and to abolish essential reforms, and urged a progressive policy in the country's North African possessions. Many members of the Workers' and Peasants' Socialist party and a number of members of the French Socialist party were arrested for their refusal to support the war.

In Belgium, Socialist Premier Paul-Henri Spaak reformed his cabinet in late January. In the general elections on April 2, 1939, 64 Belgian Labour party representatives were elected out of a total of 202, as contrasted with 70 in the 1936 elections. In the same election, the Rexist (fascist) party lost 17 of its 21 seats. The Communists elected nine deputies, the Catholics, 73. Following the elections, Premier Spaak became Minister of Foreign Affairs in the new cabinet formed by Hubert Pieriot, Catholic. Several other Socialists served in the coalition ministries formed during 1939. The Socialists urged the continuance of Belgian neutrality.

The Social Democratic Labour party of Holland during the year was admitted to the country's cabinet for the first time in its history, J. W. Albarda, president of the Labour and Socialist International, and Dr. van den Tempel, being appointed respectively to the Ministries of Waterways and of Social Affairs in the Socialist-Catholic coalition governments.

The Swiss Socialists elected 51 representatives to the National Council in the fall elections out of a total of 187, and increased their representatives in the Zurich cantonal parliament from 59 to 64. Socialists, however, were again refused a seat in the Federal Council.

In Denmark, the Social Democratic party, in the election of April 2, 1939, again emerged the leading party of the country, with a representation in the Lower House of 64 out of 149. The party, however, in this election, lost four representatives and failed, for the first time since 1920, to increase its votes. It failed to secure the abolition of the Upper House, or Landsting. It sought throughout the year to preserve Danish neutrality.

In Sweden, the Social Democratic Government in December reformed its cabinet, substituted Christian de Guenther for Richard J. Sandler as foreign minister, and added several non-Socialists to the ministry, with a view of preserving its neutrality and of uniting all parts of the country back of the Government in case of hostilities.

In Finland, the general elections of July resulted in the elections of 85 Social Democrats out of a total of 200, an increase of two over the elections of 1936. The Agrarians and Progressives, received 56 and 6 seats respectively. The so-called Patriotic National Movement, the fascistic party of the country, decreased its parliamentary representation from 14 to 8.

Following the war, the Socialists joined with the trade union

movement in proclaiming the solidarity of the Finnish working class in opposition to the Russian invasion. In the reorganized cabinet, Väinö Tanner, Socialist leader, minister of finance in the old cabinet, became minister of foreign affairs.

In Australasia, Socialists and Labourites in New Zealand and Australia gave their support to the British Government, though in each country a minority of the party members opposed sending their manpower to Europe. (See also COMMUNISM; SPAIN.)

(H. W. L.)

Socialist Party. At the beginning of 1939 it appeared that the year would see the considerable achievement of a reunion of Socialist forces, but negotiations between the Socialist Party and the Social Democratic Federation were suspended because of uncompromisable differences on the war issue. The leaders of the S.D.F. before the outbreak of war in Europe took a strong collective security stand, and after the continuance were in the vanguard of those demanding help for the Allies even under certain possible contingencies to the extent of participation in war. The Socialist Party with equal firmness worked to keep America out of war and of steps leading to war, not because it condoned Hitler's and Stalin's aggressions, but because it held that America's best service to herself and mankind would be to make democracy work, mediate for peace, bind up the wounds of war's victims and afford her citizens a chance to aid those underground movements in Europe which are the best ultimate hope of lasting peace in that continent. This opinion was general among Reading, Pa., Socialists and there Socialist unity was achieved. The Socialist administration in that city lost its campaign for re-election by a very narrow margin. In Bridgeport, Conn., Jasper McLevy and his administration were easily re-elected. His Socialist party in that State has no affiliation with any national Socialist group.

In New York State Socialists generally, with the approval of the Socialist Party, joined the American Labor Party as individuals. This was in accordance with the standing decision of the Socialist Party to act electorally with and through any genuine independent labour party. Dr. Harry W. Laidler, long a Socialist leader, was elected under proportional representation to the New York city council as an American Labor Party candidate.

During 1939 Roy Burt, after two-and-a-half years of devoted service, resigned as secretary of the party, and was succeeded by Travers Clement of California.

(N. T.)

Socialist Soviet Republics: see UNION OF SOVIET SOCIALIST REPUBLICS.

Socialized Medicine. The National Health program, which was prepared for the Interdepartmental Committee to Co-ordinate Health and Welfare Activities by its technical committee, was transmitted to President Roosevelt by Miss Josephine Roche, chairman, on Jan. 12, 1939. The President, in his message of Jan. 23, 1939, transmitted the report and recommendations on national health to the Congress of the U.S. with a recommendation "for careful study by the Congress."

On Feb. 28, 1939, Hon. Robert F. Wagner, United States Senator from New York, introduced in the Senate of the United States "A bill to provide for the general welfare by enabling the several States to make more adequate provision for public health, prevention and control of disease, maternal and child health services, construction and maintenance of needed hospitals and health centres; care of the sick, disability insurance and training of personnel; to amend the Social Security Act; and for other purposes." The Wagner health bill obviously offered a legislative means to implement the Federal portion of the National Health program.

This bill, if enacted into law, would provide appropriations to be used largely for matching State funds under the provisions of five main titles of the bill. These titles were proposed amendments or additions to the Social Security Act. Appropriations were proposed as grants to States for maternal and child welfare; medical services for children and services for crippled and other physically handicapped children; public health work and investigations; grants to States for hospitals and health centres; grants to States for medical care; grants to States for temporary disability compensation.

The terms under which these proposed grants would become available for matching State funds were to be contained in rules and regulations required to be promulgated by the chief of the Children's Bureau, with the approval of the secretary of Labor; the Surgeon General of the Public Health Service, with the approval of the secretary of the Treasury; the Social Security Board, and the Federal Emergency Administrator of Public Works. These rules and regulations would constitute the measures by which State plans contemplated under this bill would be approved or rejected.

Criticism against the Wagner health bill was voiced strongly by the professions and the hospital associations. The American Medical Association pointed out that the Wagner health bill does not safeguard in any way the continued existence of the private practitioners; does not provide for the use of the thousands of vacant beds now available in hundreds of church and community general hospitals; makes Federal aid for medical care the rule rather than the exception; does not recognize the need for suitable food, sanitary housing and the improvement of other environmental conditions necessary to the continuous prevention of disease; insidiously promotes the development of a complete system of tax supported governmental medical care; provides compensation for loss of wages during illness, but also proposes to provide complete medical service in addition to such compensation; provides for supreme Federal control since Federal agents are given authority to disapprove plans proposed by the individual States; prescribes no method for determining the nature and extent of the needs for preventive and other medical services for which it proposes allotments of funds; is inconsistent with the fundamental principles of medical care established by scientific medical experience and is therefore contrary to the best interests of the American people. The House of Delegates instead would urge the development of a mechanism for meeting the needs for expansion of preventive medical services, extension of medical care for the indigent and the medically indigent, with local determination of needs and local control of administration, within the philosophy of the American form of government and without damage to the quality of medical service. It says that any State in actual need for the prevention of disease, the promotion of health and the care of the sick should be able to obtain such aid in a medical emergency without stimulating every other State to seek and to accept similar aid, and thus to have imposed on it the burden of Federal control. The mechanism by which this end is to be accomplished, whether through a Federal agency to which any State in need of Federal financial assistance can apply, or through a new agency created for this purpose or through responsible officers of existing Federal agencies, must be developed by the Executive and the Congress, who are charged with these duties.

In submitting its preliminary report (Senate Report No. 1139, 76th Congress, 1st Session) the subcommittee of the Committee on Education and Labor points out that it is in agreement with the general purpose and objectives of the Wagner bill, S-1620, establishing a National Health program. It is expected that some proposal to implement the National Health program will be presented to Congress in 1940.

Proposals for legislation in the field of socialized medicine were

not confined to activities in the Congress of the United States. Although compulsory sickness insurance proposals were defeated in Massachusetts, New York and Rhode Island in 1938, laws pertaining to socialized medicine were enacted in 1939 in Connecticut, Michigan, New York, Pennsylvania and Vermont.

During 1939 the State medical societies of California, Michigan, Pennsylvania and the Medical Society of the District of Columbia adopted State-wide plans for the distribution of medical services to low income groups of the population within their jurisdictions. The Medical Society of New Jersey prepared a tentative State-wide proposal for the care of the indigent. Scores of county medical societies also continued to operate medical service plans for the benefit of indigent or low income people. (R. G. L.)

Social Security. The outstanding social security event of nearly 200 amendments to the Social Security Act, which completely changed the basic principles and direction of the national old age insurance program. Whereas the 1935 Act limited its monthly annuities to the covered workers themselves, the 1939 Old Age and Survivors Insurance plan extended the benefits to the aged wives and aged widows of the insured, to their dependent minor children, to younger widows with minor children to support, and, when there are no other survivors, to aged parents wholly dependent upon the deceased insured persons.

Because the new law recognizes the social necessity of providing the greatest protection to the oldest and lowest-paid workers, the new benefits are much more liberal than formerly. Annuities to retired workers at 65, called the "primary" benefits, are computed at 40% of the first \$50 of the average wage earned since entering the system, plus 10% of the balance up to \$250 monthly. One per cent of the total is added for each year since 1937 in which at least \$200 was earned. Thus, a worker attaining age 65 who averaged \$100 monthly in the preceding three years was entitled upon retirement in Jan. 1940, to 40%, or \$20, on the first \$50 of his average earnings and to 10%, or \$5, on the balance, making a total of \$25 monthly. By adding 1% for each of the three years of coverage, or 75¢, the monthly annuity became \$25.75, which will be paid to him each month for the rest of his life.

Benefits for Wives and Children.—The wife of an insured worker, upon reaching age 65, is allowed 50% of her husband's primary benefit, or in the example cited above, a total of \$38.63 monthly for the couple. She may receive a larger primary benefit if entitled to one in her own right. Each unmarried dependent child of a retired worker may receive 50% of the wage-earner's primary benefits until he reaches the age of 16, or 18 if regularly attending school.

Benefits for Widows and Orphans.—The new program also provides monthly benefits for survivors of insured workers who die after Dec. 31, 1939. Instead of the meaningless single lump-sum payments provided by the 1935 Act, a widow aged 65 or over is now entitled to three-fourths of her husband's primary benefits for the rest of her life unless she remarries. In the example used above this would amount to \$19.31 monthly. For every child under 16 or 18 she is entitled to 50% additional benefits. Widows of any age with dependent minor children are entitled to three-fourths of the primary annuity for themselves and 50% of the primary benefit for each minor dependent child.

Benefits for Dependent Parents.—If a worker leaves no other survivors, his dependent parents 65 years of age and over wholly dependent upon his support are each entitled to benefits of 50% of the primary benefits. A lump-sum payment not exceeding six times the primary annuity is paid in case no dependent survivor is eligible for any benefits. Maximum benefits permissible under

the Act are either double the primary insurance benefits, 80% of average wages, or \$85, whichever is the least, while the minimum is \$10 monthly. Earnings of \$15 or more per month automatically stop the benefits. All the above benefits are paid to or on behalf of insured workers who earned at least \$50 in one-half of the calendar quarters elapsing between the end of 1936 and the time of death or retirement, or at least in six such quarters. Orphans and widows are entitled to benefits if the worker had earned \$50 in six of the 12 quarters immediately preceding his death. The system was widened in 1939 to include workers in banks, savings and loan associations and other institutions not fully owned by the Government, certain maritime workers and persons employed beyond the age of 65. On the other hand, some small classes of workers have been excluded by the new law.

The 1939 changes halted the scheduled increase in the taxes for the three years 1940-42, keeping them at 1% each for employers and workers for this period. With the increased and extended benefits, the advance in the monthly benefit payments from 1942 to 1940, and the reduction in contributions, the menace of the huge reserves originally contemplated was eliminated. By Sept. 1939, 408,362 lump-sum payments amounting to \$22,505,990 had been certified under the 1935 provisions. In August, the average lump-sum benefit certified amounted to \$87.04, while the average of all such payments since April 1937 was \$55.11. The total assets of the old age insurance fund reached \$1,727,591,400 by Sept. 1939.

Public Assistance.—The most important amendment in the old age assistance program in 1939 increased the State grant for which the Federal Government will allow its 50% share from \$30 to \$40 monthly. The new law also emphasized the "needs" test for all Federal-State grants and required that personnel be chosen on a merit basis. The Federal subsidy for aid to dependent children was raised from one-third to one-half of the grants up to definite maxima, as in the case of the aged and the blind, and allowances are permitted for children up to 18 when attending school. During Aug. 1939, old age assistance grants amounting to \$36,415,257 were paid to 1,874,651 persons, or an average of \$19.43. In the same month 721,232 dependent children received Federal-State assistance costing \$9,337,801, the payments averaging \$31.20 per family, while 45,214 blind persons received \$1,040,180, an average of \$23.01 per person. Utopian old age pension schemes were overwhelmingly defeated by the voters of California and Ohio during the November elections.

Unemployment Insurance.—Of the 1939 changes in the unemployment insurance phase of the Social Security Act, the most significant provided that only the first \$3,000 of yearly wages should be taxed and that the State personnel be selected on a merit basis. Practically the same inclusions and exclusions as were written into the Old Age and Survivors Insurance system were made in the unemployment insurance program. A total of \$369,774,000 was paid to unemployed workers from Jan. to Nov. 1939, in the 48 States, Hawaii, Alaska, and the District of Columbia. The monthly peak of \$44,491,421 (in 4,170,406 checks) reached in August, dropped to \$26,700,000 by October. In 1938, an average of \$83.89 each was received by 2,157,522 workers under 17 of the unemployment insurance systems. At the end of Aug. 1939, the State reserves held by the Federal Government amounted to \$1,410,448,000.

Health Insurance.—Intensification of the health insurance campaign was recorded during 1939. U.S. Senator Robert F. Wagner of New York introduced a Federal-State health measure early in 1939. (See also CHILD WELFARE; LAW [CASE]: *Social Security*; LEGISLATION, FEDERAL; *SOCIALIZED MEDICINE*. (A. EP.)

Great Britain.—In the field of health insurance, apart from an Act providing for the continuance of the insurance of insured

persons engaged in war occupations at home or abroad and for certain adjustments necessitated by war conditions, there was no new legislation in Great Britain during 1939; but an important legal decision, clarifying the law as it stood, was made. In February the Court of Appeal decided that an employee who receives sickness benefit under the scheme is entitled also to be paid wages under his contract of service, and as a consequence a municipal corporation ruled that any employee falling sick should be given a week's notice and at the same time told that he would be reinstated on recovery. Under a Whitley Council ruling it was later decided that dismissal of work people in these circumstances was unnecessary and inadvisable and that existing contracts should be confirmed, any employer not intending to pay wages during sickness making this clear to the employee in writing. There are some 20,000,000 contributors to the health scheme, one-third of whom are women; contributions amount to about £31,000,000 annually, benefits to £36,000,000, administration to £6,000,000 and total accumulated funds to £140,000,000. Renewed efforts to increase the amount of and lighten the conditions attaching to old-age pensions were unavailing, as also were strongly supported campaigns to reduce the pensionable age of spinsters from 65 to 55 and to admit dependents of insured persons to health insurance benefits. The prime minister in July, sanctioning an inquiry into the old-age pensions position, made it clear that no increase that would impose an undue burden on the exchequer was possible. The inquiry then undertaken was suspended on the outbreak of war, but in November Sir John Simon promised its immediate resumption, and a report was scheduled for early 1940. There are some 3,900,000 persons drawing pensions (including 650,000 widows and 275,000 dependent children), of whom 550,000 are non-contributory. Of the £100,000,000 paid annually under the contributory, non-contributory and voluntary schemes, £14,500,000 is paid by the State for non-contributory pensions, leaving a contributory pension figure of £85,000,000 of which the exchequer provides £55,000,000, representing an income-tax of about 12s.3d. in the £.

Unemployment Insurance.—The annual census in July revealed the highest number in employment in the general scheme yet recorded—12,912,000 (656,000 more than the previous year), and the lowest unemployment figure since 1929, viz., 1,282,000; this total further decreased before the start of the war, but in December it stood at 1,361,500 (after having been higher), a number less by nearly 500,000 than that for Dec. 1938. The latest statistics show that in 1938 income on the general account was £65,895,000, about £927,750 more than in 1937, the increase derived from the classes of workers first made insurable in 1938 being offset by the decrease of employment. Expenditure totalled £62,320,000 (up £19,755,000 in 1937), and a special debt repayment of £20,000,000 was made. The income on the agricultural account rose by £64,900 to £1,942,000, and the expenditure from £700,000 to £993,650. In view of this satisfactory state of affairs benefits were increased (from March 30) and contributions reduced (July 2), these changes to remain in force till July 1942. In 1939 a short amending Act was passed providing for payment of contributions in respect of holiday periods, extending the provision of payment of dependent's benefit, and providing training courses for unemployed young persons; and after the outbreak of war the Unemployment Assistance Board was empowered to give assistance, at similar rates as those to be insured, to the uninsured who were in need through having been evacuated or through other circumstances arising out of the war. (L. H. D.)

Social Service. The outstanding events of the year 1939 in the field of social service in the United States were concerned again, as in the year 1938, with further

progress towards the adoption of new measures of public welfare, public assistance, or social security, and the development of the rapidly growing public social services in the various States. The continuation of the depression meant that very large numbers of people continued to be in need of relief in many parts of the country, and the continued lack of employment for men and women, able and willing to work, has created a grave situation, particularly in the urban industrial centres. The assistance extended to the unemployed and the so-called "unemployables" on relief has been very inadequate in every year since 1935, when the FERA came to an end. Federal aid for relief continued to be provided through the WPA, now called the Works Projects Administration instead of the Works Progress Administration.

Reports in Oct. 1939 showed that in nine out of 43 States reporting, there were very low relief averages, ranging from \$3.96 to \$9.85 per family per month. Destitute people, especially employable people, have sometimes been left to subsist on the food supplies distributed as "Federal Surplus Commodities." This long-continued inadequacy of relief, particularly inadequate food, has threatened the health of the people in some areas. A new experiment in the distribution of "surplus commodities" by means of stamps redeemable at local groceries was satisfactorily carried out in a few communities, and this experiment is to be continued in 1940 on a large scale. Direct relief was granted to a considerable number of farm families under the Farm Security Administration. Some improvement in the relief situation, however, has resulted from the removal of large numbers of families and individuals from the general relief rolls to the three important public assistance services under the Social Security Act.

During 1939 large expenditures of more than \$8,000,000 for social welfare purposes were made through Federal grants to the States for three other important services provided under the Social Security Act, but administered by the U.S. Children's Bureau, for setting up proper child welfare services; to assist the States with grants for the care of crippled children, and for maternal and child welfare. In 1939 there were 44 States with regular legislative sessions and a large grist of new legislation. Many of these new acts of the State legislatures dealt with the reorganization of the State welfare services in order to make proper administrative provision for the new and developing services; and there have also been changes in the State welfare authority to provide for greater efficiency in three forms of public assistance—child welfare, care of crippled children, maternal and child welfare, along with the special services provided by the great public benevolent institutions. An improvement in the social services through new State merit systems has been an important development. The rate of progress in the adoption of State civil service laws has been greatly accelerated. Recommendations of the President's Interdepartmental Committee on Health Services were incorporated in the bill introduced by Senator Wagner of New York but not reported back from the Senate committee until too late for action during the regular session.

Federal reorganization, delayed in 1938, made some progress in the creation of the Federal Security Agency and the Federal Works Agency. (See also CHILD WELFARE; PUBLIC HEALTH SERVICES; RELIEF; SOCIAL SECURITY; WORKS PROGRESS ADMINISTRATION.) (E. AB.)

Societies and Associations: see under specific name.

Sodium Carbonate.

Originally produced by chemical processes from salt, increasing amounts of sodium carbonate are being recovered from natural brines accumulated in salt lakes in arid regions. The United States output, now exceeding 100,000 short tons annually, comes mainly as a by-

product in the recovery of borax from brine lakes in California. Kenya exports about 40,000 tons, and small amounts are recovered in Canada and South Africa. (G. A. Ro.)

Softball. Softball boasts an estimated 1,000,000 players and 105,000 teams playing the game. Played under the supervision of the Amateur Softball Association of America, the game is making remarkable progress.

The national championship men's team of the association turned up in the Covington (Ky.) Boosters after conquering the Columbus (Ohio) team in the finals. The Alameda (Cal.) Girls, who in 1938 won the women's national championship under the name of the J. J. Kriegs, retained their laurels in 1939, defeating the Louisville (Ky.) team in the finals, in one of the most thrilling games on record. The Metropolitan League title, for which six squads competed, was won by the Newark-Linder team of girls. The Roverettes and the Americanettes representing New York in the women's contests played their games in Madison Square Garden. The former won 25 and lost 13, and the latter captured 20 and dropped 15. In eight games between the two teams, the Americanettes prevailed, 5-3. The girls' games brought new thrills indoors. (J. B. P.)

Soil Erosion and Soil Conservation.

Man-induced erosion continues to be a major problem in every agricultural region in the world, except in north-western Europe.

In North America erosion by wind and water has reached immense proportions. In the Great Plains region of the United States, wind erosion, caused largely by the destruction of vegetation through overgrazing, cropping and continued drought, has damaged millions of acres of land, much of it beyond immediate reclamation. In the high-rainfall region of the eastern seaboard, especially in the Piedmont region of the South, sheet and gully erosion have robbed the land of most of its topsoil. In the United States the erosion problem is being attacked on many sides. The Agricultural Adjustment Administration pays subsidies to farmers co-operating in the crop adjustment program, which emphasizes the substitution of soil-saving for soil-depleting crops. The Soil Conservation Service is working in some 500 selected areas throughout the country demonstrating effective erosion-control practices. Thirty-six States have enacted laws enabling farmers to establish by popular election distinct units of local Government with authority to conduct conservation operations. Farmers work co-operatively through district officials in setting up erosion control measures. The district receives assistance, such as technical personnel, materials, equipment and in some cases labour for installing control devices, from Federal and State agencies.

The Canadian erosion problem is a continuation northwards of conditions prevailing in the Prairie and Great Plains States of the United States. Official action favouring conservation first came with passage of the Prairie Farm Rehabilitation Act of 1935 which encourages recipients of drought assistance to adopt approved cropping and cultural methods.

Strip cropping, cover cropping and fallowing are promoted to check soil blowing.

The almost total absence of forests and the primitive methods of farming in some parts of the region explain the tremendous amount of erosion damage in the Mediterranean basin. Outside of Italy and the Italian and French mandates in northern Africa, very little effort at erosion control is being made. In Italy a stupendous task of land reclamation and soil conservation has been going on since 1930. It is estimated that one-third of the country will be improved under the Bonifica Integrale during the 14-year period ending in 1944.

Rapid deforestation of the Transylvanian Alps since the World War has contributed to the frequent flooding of the River Tisza and its tributaries running through the Plain of Hungary, where there is also a serious wind erosion problem. Equally serious erosion is progressing in the Rakovnik area of Bohemia and in the basin of the Borsary river in the Carpathian mountains.

In East Prussia and Poland the shifting of sand dunes is a major problem. In eastern Poland and in central Russia and the Ukraine sheet and gully erosions are quite severe, while wind erosion on the steppes and the expanding area of drifting sand in south-central Asia add to the erosion problems of the Union of Soviet Socialist Republics. With extension of mechanized co-operative farms into semi-arid sections the problem of wind erosion has greatly increased. Chief erosion-control measure thus far adopted by the Soviets is the planting of shelter-belts.

The Orient presents some of the most tragic results of erosion, and some of the best examples of soil conservation. The land around the headwaters of the Yellow river in China is the most severely eroded region in the world, while the terraced hillsides of Japan illustrate conservation at its best.

Continuous overgrazing has been largely responsible for much of the catastrophic erosion that scars the foothills of the Himalayas. Erosion does not occur to any great extent in Japan or on the European estates in Java. Large-scale sugar cane agriculture and increasing pressure of population have made erosion a serious problem in the Philippine islands. In Ceylon, where erosion on the rubber and tea plantations has become very serious, control measures are now progressing rapidly. The Ordinance of 1935 provides for treatment of badly-eroded lands; no crown lands above 5,000ft. can be alienated except by special governmental approval. All new landowners are required to install and maintain recommended erosion control measures, at their own expense.

The loss of soil by erosion is nowhere more rapid than in Africa. Veld burning and kraaling, generally employed throughout the Union of South Africa, are direct causes of accelerated erosion and have prevented natural recovery of pasture vegetation after droughts. To encourage the installation of erosion control measures, South Africa has adopted a program of Government subsidy for farmers. Since 1935 five Government schemes have operated.

In Uganda, where cotton for export is grown on large communal fields year after year, gullies two or three feet deep may occur during single rains. In Kenya a Soil Conservation Service provides special erosion control services to the farmers.

The natives of central and northern Nigeria have evolved a system of ridge and basin cultivation that effectively checks erosion. The governments of the Gold Coast and French West Africa are protecting existing trees and planting shelter-belts to prevent further extension of mobile sand areas.

In Australia erosion by both water and wind has caused tremendous damage. No unified national plan of action against erosion has yet been taken. However, the South Australian Government introduced a scheme for reducing pastoral rents with special consideration for lessees who agree to reduce their stock, fence off affected areas and set aside permanent reserves for seeding native plants and trees. In New South Wales a Soil Conservation Service has been created to co-operate with land owners in establishing anti-erosion measures.

In South America erosion has not reached serious proportions, though deforestation in many regions, overgrazing of plains and failure to use manures and fertilizers make some of the countries vulnerable to this danger. (See also DROUGHT; DUST STORMS.)

South Africa, The Union of. Area 472,550 sq.mi. (including Walvis Bay 430 sq.mi.); pop. (est. June 30, 1939) 10,160,000 (Europeans 2,116,500; native 6,997,500; coloured 814,800; Asiatic 231,200). Chief towns (pop. census 1936): Cape Town (legislative capital) (344,223); Johannesburg (519,384); Durban (259,606); Pretoria (128,621); Port Elizabeth (109,841). Governor-general: Rt. Hon. Sir Patrick Duncan; languages: English 39%; Afrikaans 56%; religion: European population: Christian (Dutch Reformed Churches 55%; Anglican 19%; Methodists 6%; Presbyterians 5%).

History.—The Union is a self-governing Dominion of the British Commonwealth of Nations. The four provinces of which it consists, the Cape of Good Hope, Natal, the Transvaal and the Orange Free State, extend from the southernmost point of the African continent to the Limpopo in the north. The former German colony of South West Africa is administered under mandate as an integral part of the Union, but this territory has not been incorporated as a Province. There are in effect two capitals: the seat of the Government is at Pretoria; the seat of the legislature is at Cape Town.

General Hertzog led the United Party as prime minister, until the outbreak of war in 1939. The period was one of considerable uncertainty owing to doubt as to the position of the Union should hostilities break out. The Government adhered to the declaration by General Herzog after the crisis of 1938 that, in the event of the United Kingdom being involved in war, the attitude of the Union would be decided by the South African parliament. In September General Hertzog's proposal for a modified neutrality was defeated in parliament by 80 votes to 67. General Smuts assumed the premiership and South Africa declared war on Germany. General Smuts's cabinet contained J. Hofmeyr, minister of finance, and Colonel Reitz, minister of native affairs. Colonel Stallard, the leader of the Dominion Party, became minister for mines, and Mr. Madeley, the leader of the Labour Party, minister for labour and social welfare. General Smuts took an early opportunity of defining the nature of the Union's participation in the war: it was, he said, to be conditioned by considerations of geography and the special conditions attaching to South Africa. Military preparations are to be confined to placing home defence in a high state of efficiency, therefore no encouragement is to be given to citizens of the Union to serve abroad. At the same time the Government promised to give physical support to the Allies in the matter of trade, shipping and finance, also to maintain the defences of Simonstown and to allow the free usage of that naval base by British warships. Only by pursuing such a policy, General Smuts declared, could the Union secure protection for the conveyance of her overseas trade. The Government's policy found a wide measure of support throughout the country. Colonel Reitz was sent to the United Kingdom to join the ministers from other

Dominions in their consultations with the Imperial Government on questions of defence. General Smuts had a majority of 17 at the end of the year and appeared to be in little danger of losing the leadership in parliament. General Hertzog's party held 38 seats and Dr. Malan's held 29. Negotiations between the two opposition leaders for a fusion of their parties are still proceeding; agreement appears likely to be based more on opposition to General Smuts's policy than on the republicanism which is the avowed objective of the Malanites. In Jan. 1940 it was announced that General Hertzog would be regarded as official leader of the opposition and would introduce a motion of no confidence in the Government at an early opportunity. Elections to the Senate took place in November and resulted in a Government majority.

The Union continues to enjoy an exceptionally sound financial position; in spite of larger expenditure on defence her citizens face 1940 without fears of heavy increases in direct taxation. It is estimated that gold production in 1939 will establish a record; the total for 11 months of the year was over 11,000,000 ounces. The Government decided to appropriate all proceeds from the sale of gold in excess of 150 shillings an ounce and some £4,000,000 additional revenue will be secured from this tax. The revenues of both the Government and the State railways are favourable. A program of public works involving the expenditure of some £6,000,000, also expenditure of some £4,000,000 by the National Road Board, are being carried through in spite of the war. The natural and industrial resources are under investigation by a committee of experts. Increased exports of wool and other produce add to the prosperity of the Union and provide essential supplies for Great Britain in her war effort. During 1939 the Union was visited by the president of Portugal and the Government has appointed a minister to represent her at Lisbon. Increasing attention is being paid to the welfare of the native population. (J. L. K.)

Education, 1937.—State and State-aided: European schools 4,471; scholars 381,550; native schools 4,850; scholars 546,225; higher, average number of students 8,707.

Banking and Finance.—Revenue, ordinary (est. 1939-40) £44,110,000; expenditure, ordinary (est. 1939-40) £44,442,014; public debt (Mar. 31, 1939) £278,876,360; notes in circulation (Aug. 25, 1939) £16,712,000; gold reserve (Aug. 25, 1939) £26,910,000; exchange rate (1938) £100:5 S.A.=£100 sterling.

Trade and Communication.—External trade: imports, total 1938 £95,886,917; (Jan.-June 1939) £48,413,783; exports, domestic (including gold ear marked) 1938 £102,906,492; (Jan.-June 1939) £68,300,483; re-exports 1938 £2,992,613. Communications and transport: roads, fit for motor traffic (1937-38) 85,428-mi.; railways, including S.W.Africa (Mar. 31, 1938) 13,620-mi.; airways, including S.W.Africa (1938): passengers carried 34,162; freight and mails carried 3,005,639 lb.; mileage flown 1,862,195; shipping (1938) entered 6,182; net tonnage 24,869,085; cleared 6,190; net tonnage 24,908,024. (Dec. 31, 1938): Motor vehicles licensed: cars and taxis 302,069; buses, vans and trucks 48,212; cycles 25,314; wireless receiving set licences 189,321; telephones, instruments in use 175,711.

Agriculture, Manufactures, Mineral Production.—Production (in metric tons): gold (1938) 12,161,392 fine oz.; diamonds (1938) 1,238,608 metric carats; maize (1938-39) total 2,535,000; coal (1938) 16,284,000; sheep, number (Aug. 31, 1938) 39,001,481; cattle, number (Aug. 31, 1938) 11,371,733; wool (1938) 94,303; wheat (1938-39) European cultivation 465,200; cane sugar (1938-39) refined 472,600; iron ore (metal content) (1938) 320,000; pig iron and ferro-alloys (1938) 294,400; steel (1937) 284,000; silver (1938) 1,135,374 fine oz.; manganese ore (metal content) (1938) 238,600; chrome ore (chromic oxide content) (1938) 79,400; asbestos (1938) 21,900; wine (1937-38) European cultivation 347,091 hectolitres; tobacco (1937-38) European

cultivation 9,236; potatoes (1937-38) European cultivation 173,695; oats (1937-38) European cultivation 86,158; barley (1937-38) European cultivation 25,809; mohair (1938) export 1,900; copper (smelter production) (1938) 11,100; ground-nuts (1937-38) European cultivation 8,700; benzol (1938) 1,900; superphosphates of lime (1937) 164,000. Industry and labour (Census 1936-37): establishments 9,987; employees, European 140,203; others 192,565; value of gross output £172,863,087; value of net output £79,931,813. Employment index, European (average 1925=100) average 1938 174.9; June 30, 1939, 177.0.

(W. H. WN.)

South America: see ARGENTINA; BOLIVIA; PERU; ETC.

South Australia. Area 380,070 sq.mi.; pop. (est. Dec. 31, 1938) 595,109. Chief town (pop. Dec. 31, 1938), Adelaide (321,412). Governor, Sir Charles Malcolm Barclay-Harvey, K.C.M.G.

History.—Sir Winston Dugan was succeeded as governor of the State by Sir Malcolm Barclay-Harvey, who arrived in Adelaide on August 12. Extensions to Parliament House costing £250,000 were completed in June and were opened by the governor-general, Lord Gowrie.

Pastoral and agricultural conditions were affected to some extent by scarcity of rainfall early in 1939 and by falling prices. The Government's active policy in combatting soil erosion was reflected in the introduction of a measure to vary the terms of pastoral leases so that lessees should be compelled to preserve a proportion of natural timber on their land. Experiments made with a Russian grass imported from the United States of America yielded good results in arresting sand drift. The year was one of great progress in manufacturing industries. Existing factories were extended, and companies were formed for the manufacture of motor cars, cellulose and sulphuric acid. In estimating a budget deficit of £570,000 for the financial year 1939-40 the Treasurer announced an increase of 4d. in the £ on income tax.

Early in the year it was reported in Adelaide that remains suspected to belong to the ill-fated Leichhardt expedition of 1848 had been discovered in the Simpson desert. An expedition led by Dr. C. T. Madigan crossed the Simpson desert and returned to Adelaide in August with valuable scientific material, but without having found any trace of Leichhardt. (L. R. MC.)

Finance.—In 1938-39: revenue, £12,303,598; expenditure, £12,700,921; debt outstanding (June 30, 1939) £110,307,250.

Communications.—Roads (March 30, 1939) 22,412-mi. fit for motor traffic; railways (1938), Government 2,557-mi.; motor vehicles licensed (Dec. 31, 1938): cars 60,537; trucks 24,985; cycles 10,213. Wireless receiving set licences (Dec. 31, 1938) 111,850.

Agriculture and Manufactures.—Wheat 43,428,423 bu.; barley 8,647,043 bu.; grapes 189,614 tons; currants 187,332 cwt.; wool 86,606,388 lb.; butter 22,428,298 pounds. Industry and labour, 1938: factories 1,980; employees 44,084; gross value of output £36,239,937; unemployment (Trade Union returns) average (1937-38) 7.3%.

South Carolina has an area of 30,989 sq.mi., including almost 500 sq.mi. of coastal waters. Pop.: 1930, 1,738,765; estimated July 1, 1938, 1,875,000. Columbia, the capital, had 51,581 in 1930, and Charleston, 62,265.

History.—Gov. Burnet R. Maybank has been sparing of pardons and has actively though unsuccessfully striven for a State police system. His recommendation to restrict the governor's pardoning power brought no response. Late in the year 1939 bands labelled K.K.K. in several up-country counties occasionally committed violence against racial or political opponents or supposedly immoral persons, which brought vigorous investigation and early

arrests. The 1939 legislative session (January 9 to July 1 with week-end intermissions) was the longest on record for the State, on account of squabbles over revenue measures, and the continued growth of local legislation of no more general concern than a town ordinance. The growing need for county legislative bodies is little realized.

Education.—Whites in public schools 1938-39, 266,882; Negroes, 220,728; expenditures respectively, \$15,952,094 and \$2,502,437. The text-book rental system was superseded in a few places by free text-books (long used in some cities). College students were allotted \$157,380 for labour or services in their institutions by the National Youth Administration 1938-39.

Charities, Correction and Social Legislation.—Inmates of the State hospital (for mentally diseased) numbered 4,372, June 30, 1938, besides 765 on parole. The State penitentiary contained, June 30, 1939, 1,258. Many prisoners of all grades are on county chain gangs. Executions, year ending June 30, 1939, ten. The Department of Public Welfare, created May 13, 1937, has distributed since then to the aged, the blind, children, etc., \$6,456,740, 45% of which was Federal funds, and also goods supplied by the Federal Surplus Commodities Corporation valued at \$3,227,307. The South Carolina Unemployment Compensation Commission (established 1936) paid to unemployed workers, year ending June 30, 1939, \$1,782,942.

Finance.—State Government's receipts for the year ending June 30, 1939, were \$53,838,838, \$6,450,082 being Federal aid. The surplus maintained for several years disappeared under the burden of social security. Total State debt June 30, 1939, \$47,313,187, mainly for highways; in addition about \$17,000,000 contingent liabilities on guarantee of county highway bonds. Federal internal revenues collected in South Carolina 1938-39 totalled \$10,533,068. Exports totalled \$9,270,091; imports \$7,866,492, duties on same being \$1,169,416.

Agriculture and Manufactures.—How well justified was Governor Maybank's attack on farm tenancy is shown by the fact that two-thirds of the farmers are tenants, a fourth of whom move annually. In several counties there are few white tenants, although generally both races are heavily represented. Federal authorities estimated 1939 production of South Carolina crops exceeded 1938 by 12%. Value of principal field and truck crops 1939, \$117,686,000, as against \$98,627,000 in 1938. Cotton yield per acre and total yield of wheat, oats, hay, tobacco, sweet potatoes exceeded all records. Farmers voted in December over 96% for Federal marketing quotas of cotton to continue in 1940. Over 1,000,000 ac. are of forests under public supervision.

Capital in all manufacturing plants June 30, 1939, was \$393,762,649; value of products fiscal year ending that date \$382,290,041; average number of employees 133,048; wages (not including salaries) \$88,365,782. The Santee-Cooper hydro-electric and navigation dam being built by a Federal grant of \$37,500,000 got well under way. (D. D. W.)

South Dakota, North Central State, admitted to the Union in 1889, is commonly called the "Coyote State." Area, 77,615 square miles. Population (1935 State census), 675,082. Capital, Pierre, population 4,013. Chief city, Sioux Falls, population 33,644. Urban population, 289,751. Rural population, including 26,996 Indians, 385,331.

History.—Republicans gained complete control of State administration, one U.S. senatorship, and the State's two Congressional members. State legislature met in 26th regular session, 1939; adopted new code, enacted capital punishment law, blood test before marriage bill, basic science law, soldiers' preference law; proposed three amendments to State Constitution to be voted on at Nov. 1940 election; 300 laws passed. Harlan John

Bushfield, 16th governor, inaugurated, Jan. 3, 1939.

Statistics.—The school census for 1939 was 163,440; school enrolment, 139,014. The State debt was \$44,869,000 on June 30, 1939. Total receipts \$31,251,385.25; disbursements, \$30,761,339.34. The total value of crops produced in 1939 was \$75,422,000; mineral production was in excess of \$20,000,000. There were no bank failures in 1939.

A continuation of drought and grasshopper plague brought distress to farmers over a wide area. The farm-to-town migration continued. Manufacturing showed a slight gain.

Highway development continued to be one of the State's principal industries. An estimated 1,000,000 out-of-State tourists visited the Badlands and Black Hills in 1939. (L. K. F.)

South Polar Regions: *see* EXPLORATION AND DISCOVERY.

South Sea and Equatorial Islands. Howland island, in the Pacific ocean, lies in latitude 0°49' N., longitude 176°42' W., approximately 1,620 mi. south-west of Honolulu, Territory of Hawaii. It was discovered by Capt. George E. Netcher of New Bedford, Mass., in 1842, and taken possession of by the United States in Feb. 1857, by A. C. Benson of the American Guano Company. In 1872, the "U.S.S. Narragansett" surveyed Howland island and found it to be about two miles long, north and south, one-half mile wide, 18 or 20 ft. high, of coral formation, and with a fringing reef. Baker island lies in latitude 0°13' N., longitude 176°33' W., within 13 nautical miles of the equator. Jarvis island is approximately 1,500 mi. south of Honolulu, Territory of Hawaii—latitude 0°22'37" S., longitude 160°01'37" W. It is 23 mi. south of the equator, is of sand and coral formation; 1.9 miles east and west by a little over a mile wide. It is saucer-shaped, the high beach rim enclosing a basin. These three islands were settled in 1936, after having been uninhabited for many years, by representatives of the Department of the Interior, and colonized by placing four young Hawaiians on each island. Their presence there definitely established the sovereignty of the United States to these islands and permitted the recording of meteorological data essential to commercial aviation in the Pacific.

In March 1938, Canton and Enderbury islands of the Phoenix group were similarly colonized and likewise placed under the Interior Department by Executive Order. Canton island is the largest and most northerly of the Phoenix islands. Its position is 2°49' S., 171°43' W. It is a coral atoll composed of a nearly continuous narrow rim of land from 50 to 600 yd. wide, enclosing a triangular lagoon about 8 mi. long by nearly 4 mi. wide at the west end. This rim varies in height from 10 to 20 ft. and is broken only by three or four lagoon entrances. The construction of local facilities by Pan American Airways is nearing completion. Test flights from Hawaii to New Zealand, using Canton as the first stop of the southward flight, were made during the year. Regular service is shortly to be scheduled. Enderbury island lies about 36 miles in the direction S. 67° E. from Canton, its position being 3°7' S., 171°3' W. It is of sand and coral formation, about 3 mi. long north and south by about a mile wide. The rim averages 15 to 20 ft. high. All these islands are of coral formation with scarcely any vegetation, and all are devoid of drinking water and afford no means of subsistence. It is necessary therefore to furnish all food, drinking water, and incidental supplies for the maintenance of the colonists. This is accomplished by sending quarterly expeditions to the islands from Honolulu. (E. GRU.)

South-West Africa: *see* MANDATES; SOUTH AFRICA, THE UNION OF.

Sovereigns, Presidents and Rulers.

The following list includes the names of those holding chief positions in their countries on Jan. 1, 1940.

Country	Name and Office	Accession
Afghanistan	Mubammed Zahir Shah, King	1933
Arabia, Saudi	Abdul Aziz ibn Saud, King	1927
Argentina	Roberto M. Ortiz, President	1938
Australia	Lord Gowrie, of Ruthven, Governor-General	1936
	Robert G. Menzies, Premier	
Belgium	Leopold III, King	1934
	Hubert Pierlot, Premier	
Bhutan	Yigme Wangchuk, Maharaja	1926
Bolivia	Gen. Carlos Quintanilla, Provisional President	1939
Brazil	Dr. Getulio Vargas, President	1934
Bulgaria	Boris III, King	1918
	George Kjusseïvoff, Premier	
Canada	Lord Tweedsmuir, Governor-General	1935
	W. Mackenzie King, Premier	
Chile	Pedro Aguirre Cerda, President	1938
China	Lin Sen, Chairman of National Gov't.	1932
	Gen. Chiang Kai-shek, President of Yuan	1939
Colombia	Dr. Eduardo Santos, President	1938
Costa Rica	Léon Cortés, President	1936
Cuba	Dr. Federico Laredo Bru, President	1936
Denmark	Christian X, King	1912
Dominican Rep.	Dr. Jacinto B. Peynado, President	1938
Ecuador	A. F. Córdova, Provisional President	1939
Egypt	Farouk I, King	1936
	Aly Maher Pasha, Premier	
Eire	Dr. Douglas Hyde, President	1938
	Eamon de Valera, Premier	
Estonia	Konstantin Päts, President	1933
Finland	Kyösti Kallio, President	1937
France	Albert Lebrun, President	1932
	Edouard Daladier, Premier	
Germany	Adolf Hitler, Fuehrer and Chancellor	1933
Great Britain	George VI, King and Emperor	1936
	Neville Chamberlain, Prime Minister	
Greece	George II, King	1935
	Gen. John Metaxas, Premier	
Guatemala	Gen. Jorge Ubico, President	1931
Haiti	Stenio Vincent, President	1930
Honduras	Gen. Tiburcio Carías Andino, President	1933
Hungary	Admiral Nicholas Horthy, Regent	1920
	Count Paul Teleki, Premier	
Iceland	Christian X, King	1912
India	Marquess of Linlithgow, Viceroy, Governor-General	1936
Iran	Reza Shah Pahlavi, Shahinshah	1926
Iraq	Faisal II, King (Regency)	1939
Italy	Victor Emmanuel III, King	1900
	Benito Mussolini, Premier, Chief of Gov't, Sec'y of State	
Japan	Hirohito, Emperor	1926
	Nobuyuki Abe, Premier (resigned Jan. 14, 1940)	
Latvia	Kārlis Ulmanis, President	1936
Liberia	Edwin Barclay, President	1931
Liechtenstein	Franz Josef II, Sovereign Prince	1938
Lithuania	Antanas Smetona, President	1926
Luxemburg	Charlotte, Grand Duchess	1919
Manchoukuo	Henry Pu Yi, Emperor Kangte	1934
Mexico	Gen. Lázaro Cárdenas, President	1934
Monaco	Louis II, Prince	1922
Morocco	Sidi Maulay Mohammed, Sultan	1927
Nepal	Maharaja Bir Bikram Jang, King	1911
Netherlands	Wilhelmina, Queen	1890
Newfoundland	Sir Humphrey T. Walwyn, Governor	1936
New Zealand	Viscount Galway, Governor-General	1935
	Michael J. Savage, Premier	
Nicaragua	Gen. Anastasio Somoza, President	1937
Norway	Haakon VII, King	1905
Oman	Sayyid Said bin Taimur, Sultan	1932
Palestine	Sir Harold Alfred MacMichael, High Commissioner	1938
Panama	Dr. Augusto S. Boyd, President	1939
Paraguay	José Estigarribia, President	1939
Peru	Dr. Manuel Prado, President	1939
Philippines	Manuel Quezon, President	1935
Portugal	Gen. Antonio Carmona, President	1926
	Dr. Antonio Salazar, Premier	
Rumania	Carol II, King	1930
	George Tatarescu, Premier	
Russia	Mikhail Ivanovich Kalinin, President	1936
	Joseph V. Stalin, Communist Secretary	
Salvador, El	Gen. Maximiliano H. Martínez, President	1935
Siam (Thailand)	Ananda Mahidol, King (Regency)	1935
	Col. Luang Bipla Songgram, Premier	
Slovakia	Josif Tiso, President	1939
South Africa	Sir Patrick Duncan, Governor-General	1936
	Gen. Jan C. Smuts, Premier	
Spain	Gen. Francisco Franco, Head of Gov't, Prime Minister	1939
Sudan	Sir George S. Symes, Governor-General	1933
Sweden	Gustaf V, King	1907
Switzerland	Dr. Marcel Pilet-Golaz, President	1940
Syria, Lebanon	Gabriel Puaux, High Commissioner	1938
Trans-Jordan	Abdullah ibn Hussein, Amir	1928
Tunis	Sidi Ahmed II, Bey	1929
Turkey	Ismet Inonu, President	1938

Country	Name and Office	Accession
United States	Franklin D. Roosevelt, President	1933
Uruguay	Gen. Alfredo Baldomir, President	1938
Vatican City	Pius XII, Pope	1939
Venezuela	Gen. Eleazar López Contreras, President	1935
Yugoslavia	Peter II, King (Regency)	1934
Zanzibar	Seyyid Sir Khalifa bin Harub, Sultan	1911

Soybeans. One of the two bumper crops of 1939 in the United States was soybeans; the other, tobacco. Soybean acreage planted, crop harvested and yield per acre were all larger than ever before. Prices were up sharply, owing to war-made demand for fats and oils in Europe and the smaller supply available from Manchoukuo because of transportation difficulties and the war in China. Acreage harvested for beans, 3,868,000ac., was nearly half the acreage planted and the crop was 79,689,000 bushels. The bean crop acreage in 1938 (not including hay crop) was 2,898,000ac. and production 57,665,000 bushels. Yield in 1939 was 20.6bu. per acre; 19.5 in 1938. Prices after the beginning of war ranged about 10¢ a bushel higher than wheat in Chicago where there was very active trade in soybean futures on the Board of Trade as well as in the spot market, Scandinavian steamers coming to Chicago for cargoes, and 8,619,000bu. being shipped out between October 1 and November 17. A bushel of soybeans weighs the same as wheat, 60 pounds. (See also CHEMURGY.)

Soybean Production by States, 1938 and 1939

	1939 bu.	1938 bu.		1939 bu.	1938 bu.
Illinois	43,080,000	31,866,000	Louisiana	216,000	178,000
Indiana	12,422,000	8,404,000	Pennsylvania	186,000	105,000
Iowa	9,993,000	5,733,000	Kentucky	180,000	108,000
Ohio	7,854,000	5,313,000	Maryland	130,000	150,000

(S. O. R.)

Spain, since March 29, 1939, a totalitarian State; area 194,200 sq.mi. (including Balearic and Canary islands); pop. (est. Dec. 31, 1936) 25,050,000. Chief towns (pop. 1934); Barcelona 1,148,000; Madrid 1,048,100; Valencia 353,000; Seville 238,750. Caudillo, or Chief of State: General Francisco Franco; language: Spanish; religion: Christian (mainly Roman Catholic).

History.—(For the war in Spain, see SPAIN, CIVIL WAR IN.) The outstanding event of 1939 in Spain was the end of the Civil War, in March. The remainder of the year was marked by the reconstruction of the political and economic framework along totalitarian lines and by unspectacular measures for repairing the ravages of more than two-and-one-half years of war.

With the collapse of the Republican Government in Madrid, General Francisco Franco, as head of the victorious F.E.T. (*Falange Española Tradicionalista*, or *Spanish Traditionalist Phalanx*), held undisputed control in Spain. Already Great Britain and France had recognized the new regime (Feb. 27), and on April 1 a similar declaration was made by the United States.

Immediately upon the occupation of Madrid, General Franco set about to remedy the serious food shortage existing especially in Madrid and other newly-conquered regions. In the capital city, some 1,500,000 rations were being distributed daily at the begin-

ning of April by the Phalangist women's auxiliary, which has many social-welfare responsibilities in Nationalist Spain. In June, the issue of food cards was begun and stringent measures were taken against hoarding and profiteering. At the same time the Government moved to consolidate its control and maintain order. At Madrid and other erstwhile Republican centres, General Franco established military tribunals, before which Republican civil officials (who are liable to punishment either by property confiscation or imprisonment for a maximum of 15 years) and Republican soldiers were ordered to appear for investigation. Among those arrested was Don Julián Besteiro, 70-year-old former president of the Republican Cortes, who was sentenced to 30 years' imprisonment in July. Censorship of the press, mails and telegraph continued, and travel in the interior of Spain was forbidden without Government permission.

Meanwhile, as the country remained relatively at peace, except for a short-lived uprising in Asturias in June, the army was gradually demobilized. By the end of April many Moroccan soldiers had been repatriated, and by early June all German, Italian and Portuguese troops had left Spain, except for a few technicians and liaison officers. Already, according to Government statement, 250,000 men had been demobilized since the end of the Civil War. The demobilization of a further 150,000 was ordered for June, and the remaining 200,000 were to constitute Spain's standing army. Economic reconstruction was a primary concern of the new Spanish Government. In speeches made during a triumphal tour of the country, and in an address delivered at Burgos in June before the National Council of the F.E.T., General Franco announced a goal of national self-sufficiency, to be achieved by the reduction of imports and the intensification and diversification of industry. With respect to foreign commerce, the Government adopted a bilateral-compensation or barter policy and rigidly controlled imports through State foreign exchange agencies. Development of the merchant marine and fishing fleets, an important part of the self-sufficiency program, was encouraged by the grant of a 750,000,000 peseta credit for loans to ship-builders, and a decree of October 24 authorized subsidies to industries of "national interest," on condition of Government participation in their management. Meanwhile, a plan for general economic recovery, involving especially unemployment relief and the construction of new and improved means of communication, had been formulated in a law of April 11, and, to accelerate the rebuilding program, all males between the ages of 18 and 45 were requisitioned for national service, in the form of either a labour or income tax. Social developments under the Franco régime consisted chiefly in the re-opening of churches which had been secularized by the Republican Government, and in changes in the universities and elementary schools.

In July, the Phalangists and Traditionalists, the allied groups composing the F.E.T., were reported in serious disagreement over the course to be followed in economic reorganization. Early in August a decree was published which modified the governmental structure and placed the Phalangist element in a position of political dominance. The decree pronounced all members of the army, navy and air corps to be eligible for affiliated membership in the F.E.T. and confirmed General Franco's absolute political authority, in the exercise of which the Caudillo "answers before God and before History." Under General Franco, and possessing important administrative and advisory powers, were the general secretary of the party, the national council (whose membership may vary between 50 and 75), and the *Junta Política*. Shortly after the issuance of the decree, the Government announced a new

ARMoured TANKS filing in review before Gen. Franco during his victory parade in Madrid May 19, 1939

cabinet, essentially a body of young men, with only one Traditionalist among its 14 members.

The foreign policy of the Franco Government was naturally influenced by the assistance which it had received from Italy and Germany, during the Civil War, and by the totalitarian structure of the new Spanish State. In the various parades in celebration of the Nationalist victory, the foreign legationaries were accorded a prominent place, and, before their departure from Spain, the Government announced (April 7) that it had joined the Anti-Comintern bloc. On May 9 Spain notified the League of Nations of its intention to withdraw. The activities of a Spanish mission to Italy in June and the visit of Italian Foreign Minister Count Ciano to Spain in July were closely followed by the Spanish press, which published, however, no official statement as to the results achieved. With Portugal, the third country to which Nationalist Spain is indebted for aid in the Civil War, the Government concluded a treaty of non-aggression and friendship on March 17 and, in December, a barter agreement contemplating a greatly increased volume of trade.

The circumstances of the Civil War created in Nationalist Spain a feeling of resentment toward the democracies of Great Britain and France, which was reflected both during and after the war by a sharp decline in the normally large trade with those countries. In April an accord was signed with France providing for the return of gold and other valuables, including war materials, which had been transported to France by Spanish Republicans. The slow execution of this agreement threatened further to strain Franco-Spanish relations, as did the violent assault by Spanish army officers on the French consul at Madrid (July 9), for which the Spanish Ambassador to France tendered his Government's apology. Relations between the two countries shortly improved, however, with the return to Spain of £8,000,000 of Republican gold (by the end of July) and of 9,000 cases of valuables in August. The repatriation of some 500,000 Spanish refugees in France also engaged the attention of the two Governments. Spain at first limited the number admitted daily, but gradually relaxed its restrictions, offering, in July, to repatriate 60,000 refugees and aid the French Government with the remainder. By December, all but an estimated 140,000 had been returned to Spain.

Considerable uneasiness was felt in Spain as a result of developments in European politics during the latter part of the year. The announcement, in August, of the Russo-German pact caused the Government some embarrassment, and the outbreak of the European war (with respect to which Spain declared her neutrality on September 4) dealt a severe blow to the country's reconstruction program and commercial policy. In 1938 and the first half of 1939 Germany had been the chief market for Spanish exports, as well as the principal foreign source of supply, and the closing of this trade seriously impaired Spain's immediate capacity to rehabilitate industry and transportation, since many industries were faced with a lack of essential equipment which they had ordered or planned to order from Germany. In this situation, the Spanish Government opened trade conversations with Great Britain and France. In December, the Anglo-Spanish conferences were declared to be proceeding satisfactorily, although high Spanish prices were causing some difficulties. Negotiations with France broke down suddenly on December 20, after the near completion of a 600,000,000 franc bi-lateral compensation agreement, but were expected shortly to be resumed.

Banking and Finance.—The financial structure has been severely shaken by the losses in the gold reserve and by the increase of the internal debt, mostly in the form of issues of paper currency; the amount of this currency, although unrevealed, is probably very large, but there have been no internal bond issues or closing of banks. There is no funded foreign indebtedness, but

commercial obligations amounting to more than \$50,000,000 were contracted and blocked before the outbreak of the Civil War, and other heavy obligations, of undisclosed amount, were contracted during the war by the present Government, especially with Italy. The peseta dropped from 10.35 to the dollar before the European war to 12.55 to the dollar on December 9. A Government decree releasing some 3,500,000 Republican pesetas which had been impounded during the Civil War created fear of further inflation. (See also ARMIES OF THE WORLD; EUROPEAN WAR; MINORITIES; RELIGION; SOCIALISM.)

Spain, Civil War in. By March 29, 1939, all Spain lay in the hands of Nationalist General Francisco Franco, and the Spanish Civil War, after two years and 254 days of bitter fighting, was finally at an end. The triumph of the insurrectionaries was the result largely of material superiority and foreign aid. From both Italy and Germany, General Franco received a continual flow of war necessities. In addition to technicians, planes and submarines, Germany contributed the Condor legion, a German army unit numbering some 15,000 men. Italy (according to the *Forze Armate*, an official publication of the Italian army and navy) transported 100,000 troops to Spain between mid-Dec. 1936 and mid-April 1937, sent an air force of more than 6,000 men and supplied General Franco with 4,370 tanks, trucks and automobiles, 750 cannon and 40,000 tons of ammunition. Portugal also aided the Nationalist cause, providing some 10,000 men (according to the Portuguese press). The Republican Government's chief foreign source of war materials was distant Russia, from which, because of the circumstances of the war, shipments could usually be received only over the Pyrenees, while even this channel of communication was not always allowed to remain open by the French Government. Besides its inferiority in war materials, the Republican Government had to contend also with a constantly diminishing food supply and internal dissension, while the Nationalists enjoyed both political harmony and a condition of comparative plenty. The campaigns which brought the fall of Barcelona in January and Madrid in March 1939 were but military incidents in a struggle whose outcome already was evident from the disparity between the material resources of the contending sides.

By Dec. 1938, having massed along the Ebro front some 300,000 troops, a huge armada of German and Italian planes and batteries of 9-in. guns, General Franco was ready to deliver a decisive blow. Two days before Christmas, the Nationalists opened their campaign with a terrific bombardment, and drove rapidly across the Segre river, at the same time advancing upon Tortosa in the south. The capture of Borjas Blancas (Jan. 5, 1939) and Montblanch (January 11) threatened to cut off the Republican forces in southern Catalonia and led to the fall of Tortosa on January 13. The Republicans ordered to the front all able-bodied men between the ages of 20 and 45, militarized all supplementary war industries and food agencies, and began a counter-attack on the Madrid front, near Brunete—but to no avail. From the south-west and the north-west the Nationalists pressed hard upon Tarragona, capturing the city, along with Reus, on January 15, after having earlier forced the withdrawal of Republican troops from southern Catalonia. On January 26 Barcelona fell, almost without resistance.

On February 1, before 62 members of the Republican Cortes meeting at Figueras, Premier Negrín delivered an address urging that the fight be continued in Central Spain if Catalonia were conquered. Meanwhile the Nationalists pressed toward the frontier,

CIVILIAN REFUGEES of Loyalist Spain in the Pyrenees near Olot after the fall of Barcelona Jan. 26, 1939

entering the border towns of Puigcerdà, Le Perthus and Cerbère on February 10, with which military operations virtually ceased. Already President Azaña, Premier Negrín and other Government members had crossed into France, along with hundreds of thousands of military and civilian refugees.

The Civil War now moved rapidly to a close. Accorded the recognition of Great Britain and France on February 27, shortly followed by that of other countries, General Franco concentrated his forces outside Madrid, which, with the return of Premier Negrín and his cabinet on February 12, had been re-established as the capital of Republican Spain. Meanwhile events within Madrid presaged the collapse of further Republican resistance. With the announcement on February 27 of President Azaña's resignation, Premier Negrín took over control of the Republican army from General Miaja. This was his last important act as prime minister. On March 6, a National Council of Defence, headed by General Miaja, overthrew the Negrín Government, whose members escaped to France, and assumed control of Republican Spain. This new move, for which motives were rather obscure, was followed on the 7th by a revolt of Communists and supposed adherents of the ousted premier—the second rising against the Republican Government, which had faced an Anarcho-Syndicalist insurrection in Catalonia in May 1937. By March 13 the revolt had been put down, after heavy fighting, and the Defence Council turned its efforts to the securing of an honourable peace.

Between March 19 and 26 negotiations by radio and personal interview were conducted with General Franco, who, aside from ordering the blockade of all Republican ports, had remained inactive while his opponents fought among themselves. The Nationalist commander demanded unconditional surrender. The Republicans insisted upon the safe evacuation of certain of their leaders. A deadlock ensued, and on March 26 General Franco opened an offensive in the Toledo and Córdoba sectors which proved to be the final blow. On March 27, Almadén fell and the Republican air force surrendered, and on the next day 200,000 Nationalist troops, meeting no resistance, entered Madrid, from which the Government had already fled. Twenty-four hours later nearly all the provincial capitals were in General Franco's hands,

and on March 29 at 2:20 p.m. the Spanish Civil War was officially pronounced to be at an end. (See also *ARMIES OF THE WORLD; INTERNATIONAL LAW; ITALY: History; LIGHTNING WAR; RELIGION; SHIPPING, MERCHANT MARINE.*)

(C. E. CH.; R. H. SH.)

Spanish-American Literature. Recent "ideologies" have caused in Spanish America a state of great activity. Governments have entered the field of publication, thus offering the creative forces of every country an opportunity for expression. Besides, the economic and political conditions now existing in the Old World are displacing to the New the centres of Western culture. This is most significant. A new era has commenced for Spanish America. From Germany, Austria, Poland, Russia, Italy and Spain a good number of scientists, philosophers, educators, artists and workers have migrated to Buenos Aires, Mexico City, Montevideo, Santiago, Habana, Bogota. And so have the great publishing houses of Spain. Buenos Aires is rapidly becoming the literary centre of the Spanish world. Espasa-Calpe, Editorial Lozada, Editorial Tor and others now in the Argentinian capital are offering in increasing numbers the world classics of yesterday and of today and are stimulating literary production to an amazing degree. In Spanish America authors now find publishers for their books without having to go to Paris or Madrid, and the book market is being organized for the first time in history.

Generally speaking, the essayists, novelists and poets of Spanish America, whether they belong to the "right" or to the "left," seem to share a common interest and a common desire: to study and to understand Spanish American realities and point to their significance and their values. The essayists lead the group, now surveying the economical, political, racial and social conditions in their countries, as Mariano R. Tissebaum in *El nivel de vida* (the standard of life in Spanish America in its relations to wages), Obdulio Pulido in *Voz alta* and Ramón Díaz Sánchez in *Transición* (studies on Venezuelan conditions), Moisés Sáenz in *México íntegro* and José Vasconcelos in *El Proconsul* (masterful comments on modern Mexico in its struggles to conquer itself), Juan Luis Merchán in *De donde vienen los negros* (scholarly discussion on the origin of the African peoples that were brought

to the Antilles) and Anténor Orrego in *El pueblo continente* (an original interpretation of the Spanish American soul); now presenting the lives and characters of leading personalities, without failing to comment on the environment in which they lived and acted, as Luis Alberto Sánchez in *Garcilaso Inca de la Vega*, Germán Arciniegas in *Jiménez de Quesada*, Julio Jiménez Rueda in *Juan Ruiz de Alarcón y su tiempo*, Juan Pablo Echagüe in *Seis figuras del Plata*, Manuel Gálvez in *Vida de Hipólito Yrigoyen* and F. Cossío del Pomar in *Haya de la Torre, el Iudoamericano* (a sympathetic view of the leader of the revolutionary party of contemporary Peru); now criticizing the present conflicting "isms" that aim to control the world of politics and defending the traditions and institutions of Spanish America, as Rafael Arévalo Martínez in *Viaje a Ipaná*, Moisés Vincenzi in *Marx en la fragua*, Alberto Zum Felde in *El ocaso de la democracia*, Francisco E. Padilla in *Democracia y totalitarismo*, Francisco Núñez in *De Hegel a Stalin* and Vicente Dávila in *Problemas sociales*; and finally, aiming to find the path that Spanish America must follow to protect its great future, as Julio E. Moreno in *Humanidad y espiritualidad*, Enrique Molina in *De lo espiritual de la vida humana*, Jorge Roa in *Biología social*, and above all Luis López de Mesa in *Disertación sociológica*, the most comprehensive, bold, profound and brilliant essay ever written about the origin, evolution and destiny of culture in Spanish America.

Pure prose fiction does not seem to have attracted special interest among Spanish American writers in 1939. High quality production did not keep up the standards of the immediate past. We have noticed: *Cantares y tradiciones del Tucumán*, by Juan Alfonso Carrizo, *Los payasos poetas del pueblo*, by Armando de María y Campos, *Medallas antiguas*, by Juan María Ravelo and *Cosas de mi pueblo*, by J. M. Fernández Consuegra, among the writings of folkloric nature; *Agua salada*, by José Fabiani Ruiz, *Camino Real*, by Juan Bosch, *Guaraníes*, by Martín de Goycochea Menéndez and *Antología del verdadero cuento chileno*, ed. Miguel Serrano, among the realistic short stories, and *20 cuentos*, by José Restrepo Jaramillo, *La sombra alucinante*, by Angélica Palma, *Mies tardía*, by Genaro Fernández Mac Gregor, *Cuentos del México antiguo*, by A. del Valle Arizpe, *Sueños para la infancia del mundo*, by Félix M. Pelayo, *Cuentos en el primer solsticio*, by Matías Milla Solsona, *Mirador*, by José G. Montes de Oca and *Germinal* by Marcos Caria Reyes, among the collections of stories

of pure fantasy, even if at times with a background somewhat realistic.

The novel followed in 1939 the trends of the immediate past: *Huasteca*, by Gregorio López Puentes; *La monja de la revolución*, by Ricardo I. Vasquez; *Liberación*, by Arturo Mejía Nieto; *El estanque*, by Dora de Aguirre; *El puño del amo*, by Gerardo Gallegos; *Regina Landa*, by Mariano Azuela; *Resaca*, by César Carizurieta, and *Noviembre* by Humberto Salvador, are novels depicting social and political conditions in Mexico, Honduras, Venezuela and Ecuador. Juan Marín, the famous author of *Paralelo 53, Sur*, wrote in *Naufragio* and in *Orestes y yo* two psychological novels of intense interest, and María Luisa Bombal in *La amortajada* a strange and powerful symbolical narrative.

True to its well established tradition for excellence, Spanish America produced in 1939 a great number of poetic works of various nature and tendency: Carmen Alicia Cadilla published her *Canciones en flauta blanca*, childlike, delicate, exquisite; Lucia Victoria Goitea her *Ensueño y realidad*, erotic, pantheistic; Rogelio Sotela his *Apología del dolor*, simple, spontaneous, sentimental; Antonio Arraiz his *Cinco sinfonías* and *Aspero*, noble and sympathetic verse written in defence of the Venezuelan Indians; Isa Caravalló her *Vendimia de huracanes*, restless, impassioned and courageous defence of the Cuban proletariat; Eugenio Florit his *Doble acento*, romantic, exquisite; Alberto Hidalgo his *Dimensión del hombre*, pure, spiritual, classic; María Raquel Adler her *Sonetos de Dios* and *Buenos Aires, ciudad y poesía*; Edgardo Ubaldo Genta his *La epopeya de América*, first canto of an ambitious epic promised by the inspired Uruguayan; Osvaldo Bazil his *La cruz transparente*, intimate, highly subjective and artistic; and Carlos García-Prada his *Luz que flota en el Olvido*, a precious selection of sonnets by 33 Colombian poets in which are to be found some of the most beautiful ever written in the Castilian language, and the song of a nation—Colombia—so distinguished for its poetic expression.

(C. G.-P.)

Spanish Colonial Empire. Total area (approx.) 322,300 sq.mi.; total population (est. Dec. 31, 1937) 26,055,000.

The following table lists the colonies, protectorates, etc., of Spain together with certain essential statistics appropriate to each of them, including the mother country itself:

Country and Area sq.m. (approx.)	Population Estimated Dec. 31, 1937 (000's omitted)	Capital, Status, etc.	Principal Products (in metric tons)	Imports and Exports (in thousand pesetas)	Road, Rail and Shipping	Revenue and Expenditure (in thousand pesetas)
Spain, including Canary Is., and Balearic Is., 194,200.	25,050	Madrid, republic, <i>President:</i> General Francisco Franco Behamonde				
AFRICA Ceuta and Melilla, 77	115	—, administered as part of Spain.	exports (1934) raw materials 899,553, manufactures 12,892	(1934) imp. 47,546 exp. 14,500		
Morocco, Spanish, 8,080	750	Tetuan, protectorate <i>High Commissioner:</i> General Carlos Asensio	(1936) iron ore (metal content) 579,000; (1934) antimony ore (metal content) 314	(1936) imp. 60,600 exp. 26,700	rds. c. 500 mi. rly. 80 mi.	(1936) rev. and exp. 50,271
Spanish Guinea, including Fernando Po, Rio Muni and four small islands, 10,380	120	Santa Isabel, colony.	(1934-35) cocoa 14,900 coffee	(1930) imp. 17,625 exp. 21,970		(1932) rev. and exp. 11,020
Western Sahara, including Ifni, Rio de Oro, and Spanish Sahara, 109,600 .	20	Villa Cisneros, colonies.	fish and dates			(1929) rev. and exp. 6,947

Spanish Guinea: see SPANISH COLONIAL EMPIRE.

Spanish Morocco: see SPANISH COLONIAL EMPIRE.

Spanish West Africa: see SPANISH COLONIAL EMPIRE.

Spelman Fund of New York was chartered in 1928. The Fund, during 1939, continued its program directed at the improvement of the methods and techniques in the field of public administration. Support was extended to public and quasi-public agencies engaged in circulating information regarding advances in administrative practice, in developing new types of organization and operating methods, and in actually installing administrative improvements in governmental agencies. During the year, the Fund appropriated \$886,500.

The Chairman of the Board of Trustees is Charles E. Merriam; the Executive and Secretary, Guy Moffett. (G. Mtr.)

Spices. Three important occurrences marked the year 1939: (a) Pepper trading on the Produce Exchange of New York attained impressive volume, making that city the dominant pepper market of the world; (b) Because it consumes annually 50,000 tons of spices the change of food laws (June 25) of the United States will affect quality and labelling everywhere; (c) A war market began September 1 and excited activity continued about 30 days, when suggestions of peace caused prices to react. Mounting ocean freight rates and war risk insurance accounted for some advances.

By October 25, 75% of the rise had vanished.

Madagascar controlled the clove market as Zanzibar sellers preferred not to meet competition. As the year drew to a close, this situation was reversed and large sales by Zanzibar were made to all markets.

The war in China did not stop shipments of cassia, although prices were higher, reflecting the increased cost of transportation by land and sea. Adequate quantities continued to come to the principal consuming markets. There was marked improvement in cassia quality through protection of the bark against deterioration, better drying and cleaning.

Gingers on a gold basis reached an historic all-time low, the Sierra Leone variety selling during the spring of 1939 at parity with \$1.95 per 100lb. which price included transportation to steamer, bags, insurance, and ocean freight to New York. Sellers of India and Jamaica gingers had to reduce their prices to comport with the lower value established in Africa. The increased production of nutmegs in the island of Grenada was well absorbed by the London and New York markets. Prices moved about 35% above the figure at which the 1939 market opened.

Since Jan. 1939, the black pepper market has fluctuated within a range of 1½¢ per pound. It sold for a short time at 3¢ per lb. c.i.f. New York. As of October 1, there were in New York warehouses 627,281 bags of Lampong black pepper, sufficient with manufacturers' stocks to meet U.S.A. requirements for about 3½ years. This heavy accumulation resulted from speculative desire to hedge against possible monetary inflation. As the year closed, stocks of black pepper in New York warehouses stood at 647,666 bags, up 100,734 bags from Dec. 31, 1938. The crop considerably exceeded estimates, amounting to 42,000 tons.

Mustard Seed.—Consumption appeared to be increasing. The improved qualities of mustard products in countries of large population accounted for much of this. A high market prevailed from September as the usual supplies from Poland and Germany became unavailable. The Netherlands embargoed its bountiful 1939 crop and England may not thresh its harvest until spring, 1940. Acreages elsewhere are likely to be increased for the 1940 crop, notably in Denmark, California and Montana.

Spain and Hungary have placed paprika (1939 crop) under strict Government control. Prices are much higher than the opening figures for the previous crop. Other countries are responding elatedly to this strong incentive to increase their paprika acreages. (C. A. T.)

Spingarn, Joel Elias (1875-1939), U.S. educator and author, was born in New York city on May 17 and was educated at Columbia university, where he received his doctorate of philosophy in 1899, and at Harvard. From 1899 to 1911 he taught comparative literature at Columbia; in the latter year he purchased the *Amenia* (N.Y.) *Times*, of which he was publisher for the next 15 years. During the World War (1914-18) he was major of infantry in France. When he returned he helped found the publishing firm of Harcourt, Brace & Company and was for many years its literary adviser. He also founded a movement for rural recreation, was a director of the Horticultural Society of New York, and president of the National Association for the Advancement of Colored People. In 1913 he established the Spingarn medal for "highest achievement . . . in any honourable field" by an American citizen of African descent. The 1938 medal was awarded to Marian Anderson, Negro singer. Spingarn was the author of many volumes on the history of literature, literary criticism, poetry and horticulture. He died at New York city on July 26.

Spirits: see LIQUORS, ALCOHOLIC.

Squash Racquets. Squash racquets welcomed a notable veteran player as national champion when Donald Strachan, of Philadelphia, won his way to the title which he held in 1936. In the three intervening years Germain G. Glidden, of New York, wore the crown and retired as undefeated champion. Strachan, who exhibited excellent court strategy, defeated Stanley Galowin, of New York, in three straight games in the finals, although the latter team was successful in winning the New York State title.

The contest for the national doubles championship was a particularly keen one, with the winning team of Hunter H. Lott and William S. Slack, of Philadelphia, retaining their title by beating Galowin and Fred Alexander. Another exciting exhibition was displayed in the Metropolitan doubles championship, won by Don Nightingale and Sam Cochrane, of the University club, in turning back the defending champions, Beekman H. Pool and Conway Hoffman. Bernard H. Ridder, Jr., of the University club is the Metropolitan singles class A champion.

The competition for the national professional championship is always watched with unusual interest by players and followers of the game, who were quick to acclaim the successful New Yorker, Les Cummings, instructor of the Union club. He won the title in Cleveland, defeating Jack Summers, the coach of Massachusetts Institute of Technology.

Among collegians, the best in the field was Stanley W. Pearson, Jr., of Princeton university, winner of the national intercollegiate crown, and the University club's intercollegiate invitation singles tourney for the second straight year.

Showing her superiority in the game, Miss Anne Page, of Philadelphia, became the women's national champion for the third time (also in 1936 and 1937), defeating Miss Elizabeth Pearson, of Philadelphia. A strong duo came to the fore in the women's national championship, won by Mrs. John Bierwith and Mrs. William H. Adams, of New York. Mrs. Ary J. Lamme, Jr., won the Metropolitan singles championship class A, for the fourth time, and the New York State singles title for the second year.

(J. B. P.)

Stalin, Joseph Vissarionovich (1879—), Russian statesman and general secretary of the Communist party of the U.S.S.R., was born in Georgia and succeeded Lenin as virtual dictator of the Soviet Union in 1924 (see *Encyclopædia Britannica*, vol. 21, p. 301). Stalin startled the bulk of his countrymen and most of the world by his sudden reversal of Aug. 21, 1939, when announcement was made in Berlin that the U.S.S.R. would sign a ten-year pact of non-aggression with Germany. In retrospect, Stalin had first indicated this momentous shift March 10 when, in his opening address before the 18th Congress of the Communist party at Moscow, he accused France and Great Britain of wishing to foment a war between Russia and Germany. The second indication was the announcement on May 3 that Maxim Litvinov, a bitter anti-Fascist, had been dismissed as foreign commissar and replaced by V. Molotov (*q.v.*), who as Stalin's mouthpiece declared on May 31 that Russia would not sign a pact with the Allies unless all countries on its western frontier were guaranteed—a difficult condition for France and Britain to fulfil.

Stalin issues few public pronouncements, and the trends of his policy must be garnered mostly from the statements of subordinates and from the Soviet press. A flood of conjecture concerning the effects of the non-aggression pact followed its announcement. Upon one point, however, most observers agreed: that Stalin had temporarily strengthened the international position and security of Russia at the expense of the Comintern and, as events turned out, at the expense of peace in Europe. (See also UNION OF SOVIET SOCIALIST REPUBLICS.)

Stamp Collecting: see PHILATELY.

Standards, National Bureau of. This bureau, established by Act of Congress March 3, 1901, is part of the Department of Commerce. Its services in the fields of research, testing and commercial standardization are available to the National and State Governments without charge, and under certain conditions to the general public. The bureau is made up of the following divisions: electricity, weights and measures, heat and power, optics, chemistry, mechanics and sound, organic and fibrous materials, metallurgy, clay and silicate products, simplified practice, trade standards, and codes and specifications.

The regular staff on June 30, 1939, consisted of 950 employees and 80 research associates. The appropriation for the fiscal year 1939 was \$2,615,000, including \$500,000 for the construction and equipment of a new high-voltage laboratory and \$198,000 for continuing the investigation of building materials and structures for low-cost housing.

As part of the international program for the redetermination of the values of the electrical units on an absolute basis, new values for the ohm and ampere have been reported, but developments in Europe make it uncertain as to when these new values for the units will be adopted. The 29th National Conference on Weights and Measures, which met at the bureau in June 1939, went on record as favouring the quantity standardization of packaged food.

Testing of railroad track scales and of motor-truck scales has been continued, the railroad track scales showing the highest percentage (84.2) of scales within tolerance thus far recorded.

The radio sonde or radio weather recorder, developed by the bureau, has been put into regular use by the Navy, weather bureau and other Government agencies. Because of its low cost and its availability even in bad weather, it has supplanted aeroplane flights as a means for recording upper air conditions.

The bureau's part in the international research on the properties of steam was completed, and the results are being combined with those from other laboratories to serve as the basis for more precise steam tables.

Certain petroleum hydrocarbons are being studied so as to obtain the information needed for synthesizing the best possible fuel for aviation engines.

As a by-product of ruling fine linear scales, a small and sensitive diamond tool has been developed for measuring the hardness of glass and many other materials.

The Munson and Walker table for determining reducing sugars was revised to make it more readily applicable to samples of synthetic molasses now being imported in increasing quantities.

Many radium preparations were tested, including 377 with a radium content of 2,940mg. for the National Institute of Health. These were part of a lot of 9g. of radium, the largest single shipment ever received by the bureau.

An important discovery is the fact that the new synthetic material, neoprene, is less permeable to hydrogen, helium and carbon dioxide than ordinary rubber, thus making it particularly suitable for the gas cells of airships.

Several improved analytical methods have been developed for ferrous and non-ferrous metals and for gases.

In co-operation with the Bureau of Public Roads a new "Federal yellow" colour was developed for highway signs, and another, which will become standard in all 48 States, is known as "national school bus chrome," and will be used for painting school buses.

A test procedure has been devised for measuring the compressive strength of thin sheet metal. Many sheets are placed together in a pack and are kept from bending by a special apparatus. The results show that the compressive properties of sheet metal are often very different from the tensile properties—an important matter in designing aeroplanes and other light structures.

In the hydraulics laboratory, experiments were made on a model of the Indian Rock dam for the Engineer Corps of the Army. The work showed that certain changes should be made in the stilling basins, and these are being incorporated in the full-sized structure which will protect the city of York, Pa., against floods.

The effects of using new and unfamiliar materials in book papers have been determined with the aid of the Government Printing Office. It is now possible to predict approximately how long present-day papers will last under various storage conditions.

New test methods for leather have been developed in co-operation with the American Leather Chemists Association, and a technique for measuring acidity, which is a good indication of the probable resistance of leather to atmospheric exposure, has been used successfully.

The properties of light alloys have been studied with special reference to the effects of vibration and low temperatures on impact resistance. This work has included the examination of parts of wrecked aeroplanes to aid the Government in determining the causes of these accidents.

Because cooling water in air-conditioning systems is used over and over again and becomes contaminated from the impurities in the air, it often is very corrosive. The destruction of piping in these systems is a serious problem. The bureau has suggested certain treatments of the water which will reduce this attack.

All the information that can be obtained about pure iron is necessary for the preparation of new alloys having definite properties. Several ingots of iron, which contain total impurities not exceeding 1/100 of one per cent, have been cast, and their characteristics are being determined.

The technique of making high-quality optical glass for the Navy was improved so that 8,422lb. of satisfactory glass were obtained from 50 melts, as compared with 8,400lb. from 62 melts in 1938.

Investigation of the toxicity of coloured glazes for chinaware showed that only two of these (a green glaze containing copper and lead, and tangerine—a lead glaze) constitute a possible hazard. Care must be used, however, to prevent the marketing of undesirable glazes.

The bureau has demonstrated that a plastic hydrated lime, having satisfactory keeping qualities, can be produced by autoclave treatment, thus making a large saving possible because of the 8% to 10% increase in yield.

Over 7,000,000bbl. of cement were tested for the Federal Government at the bureau's branch laboratories. The Cement Reference Laboratory, which is maintained jointly by the bureau and the American Society for Testing Materials, started a sixth inspection tour of commercial testing laboratories.

Thirteen new Simplified Practice Recommendations and an equal number of Commercial Standards were printed, and many conferences were held which will lead to additional projects.

A new code for the protection of the heads, eyes and lungs of industrial workers, and one section of the revised National Electrical Safety Code were issued. A new edition of the bureau's publication on building codes was published.

Five hundred public purchasing officers were supplied with information on the use of specifications in buying supplies, and with lists of manufacturers who are willing to certify that their products conform to certain nationally recognized specifications and commercial standards.

The properties of 28 special types of wall, floor and partition constructions, recommended by their sponsors for low-cost house construction, were determined. Rain penetration through masonry walls was measured, and a survey was conducted of the types of roofing materials in use in the eastern section of the United States.

Metals, composition materials, building boards, papers, floor coverings, etc., have been tested and reports issued describing their performance. Typical plumbing systems are being studied to show where economies are possible without sacrificing efficiency and with proper safeguards to health.

An experimental dwelling was constructed in which service tests can be made on heating systems. Among other features, the heights of the ceilings can be varied to determine the influence of this factor on fuel consumption.

Good progress has been made on the new high-voltage laboratory, and it is expected that the building will be finished early in 1940.

The results of the year's work were made available through 288 printed publications and articles. In addition 30 mimeographed letter circulars and notes on matters of current interest were prepared and distributed on request.

(L. J. BR.)

Stanford University (The Leland Stanford Junior University). In the year 1939 construction was begun on a new \$600,000 building to house the extensive collections of the Hoover Library on War, Revolution and Peace. The building is a gift to the university from a number of private donors, including John D. Rockefeller, Jr., and from the American Children's Fund, Inc. At the Stanford Medical school, in San Francisco, the Ruth Lucie Stern Research Laboratory was built at a cost of \$100,000 as a gift from Mrs. Louis Stern, of Palo Alto. A further grant for medical research of \$75,000 over a period of five years was received from the Rockefeller Foundation. The Child Guidance Clinic was established with a gift of \$10,000 a year for three years from the Commonwealth Fund.

The expanding program in basic biological research which has been going on for some years was given support through an additional gift of \$200,000 from the Rockefeller Foundation.

The Klystron was invented and developed by members of the Department of Physics as an important apparatus for generating and detecting ultra high-frequency radiation. It promises to be of value not only in aviation but in many other fields.

In spite of existing limitations on the number of students admitted to the lower division and to certain schools, there was an increase in the total number of students because of additional admissions in the upper division and graduate years. The faculty in 1939 numbered 575; the students 4,345 of whom 1,321 were women and 1,186 were graduates. (R. L. W.)

Stark, Harold Raynsford (1880-), American naval officer, was born at Wilkes-Barre, Pa. on November 12. Graduated from the U.S. Naval academy in 1903, he was commissioned ensign two years later and served on various ships and at various naval stations from 1903 to 1917. During the World War he was on the staff of Admiral William S. Sims, commander of the U.S. Naval forces in European waters. He was chief of staff of the Battle Fleet's destroyer squadrons from 1928 to 1930 and chief of the Naval Bureau of Ordnance from 1934 to 1937. He was promoted to rear admiral Nov. 2, 1934. On March 15, 1939 he was appointed chief of naval operations to succeed Admiral William Daniel Leahy, who on June 6 was appointed governor of Puerto Rico. Stark assumed office on August 1 with the rank of admiral.

Stars: see ASTRONOMY.

Starzynski, Stefan (1893-), Polish politician and mayor of Warsaw from 1937 to 1939. He was educated at the High School of Commerce in Warsaw and joined the Polish Army in 1914, in which he fought till the completion of the war with Russia some seven years later. From 1921 to 1924 he was a member of the Polish delegation to the Polish-Soviet Commission for Repatriation; in the latter year he entered the ministry of finance, later becoming (1926-29) deputy director. He was appointed under-secretary of State for finance in 1929. A close student of municipal government and an expert on utility plants, he was elected mayor of Warsaw in 1937. In 1935 he had visited the United States to study at first hand the administration of New York city's government. When the German forces approached Warsaw in Sept. 1939 he organized civilian defence of the city and worked ceaselessly to inspire the population's resistance and maintain its morale. His refusals to yield the city earned him the sobriquet, "Stefan the Stubborn." His radio broadcasts of appeal for British and French assistance were heard throughout the world. According to German press dispatches, Starzynski committed suicide on September 28, the day after Warsaw's surrender, but later reports indicated he was still alive.

State Legislation: see LAW (CASE).

Steamships: see SHIPBUILDING; SHIPPING, MERCHANT MARINE.

Steel: see IRON AND STEEL.

Steiwer, Frederick (1883-1939), U.S. senator, was born in Jefferson, Ore., on October 13 and was educated at Oregon State Agricultural college and the University of Oregon. He was admitted to the bar in 1908 and continued legal practice until 1926. From 1927 to 1938, when he resigned because of ill health, he was a member of the U.S. Senate. Though a confirmed Republican, he voted for many New Deal measures such as the NRA, AAA and TVA in Roosevelt's first term. He delivered the keynote address at the Republican national convention in 1936 which nominated Alfred M. Landon for the presidency and was in prominence also at that time as a possible candidate for vice-president. Steiwer died at Washington, D.C. on February 3.

Stengel, Alfred (1868-1939), American physician, educator, and author, was born November 3 at Pittsburgh, Pa., and received his medical degree from the University of Pennsylvania in 1889, where for many years he was professor of medicine and vice president. He was the author of a text-book of pathology, numerous articles in medical volumes and periodicals, and was American editor of Nothnagel's *Cyclopedia of Medicine*. He died in Philadelphia April 10.

Sterilization. Sterilization here applies to the prevention of reproduction by eliminating the possibility of the fertilization of the female cell (ovum) by that of the male (spermatozoon). In general, this is accomplished by the introduction of a barrier to the passage of these germ cells from the ovary of the female through the Fallopian tubes to the cavity of the uterus, or of those of the male from the testicle through the vas deferens. The term is not to be confused in this consideration, as being synonymous with contraception or castration. The results are the same but there is a difference in that contraceptive procedures do not sterilize either the male or female, while castration prevents the future formation of any germ cells by the removal of the ovaries or testes, as the case may be.

This procedure is justified by considerations of pre-existing diseases of such a type as to render reproduction a distinct maternal hazard. Again, certain eugenic considerations may be the determining factor against the production of offspring from a certain mating. In these instances of hereditary determinations either of the parents may present the aetiological factors justifying the sterilization of the particular individual and that one alone should be prevented from reproduction.

In the male sterilization is usually accomplished by incising the scrotum, under local anaesthesia, over the course of the vas deferens on each side. This small duct is carefully separated from the surrounding structures and doubly ligated. It is then cut and a small segment removed. The incision is closed and in most instances, healing is rapid and uncomplicated. Instances have been reported where males have had supernumerary ducts leading from the testicle. One such case has come under the author's observation. In this case, an epileptic, pregnancy followed the vasectomy and it was necessary to operate again and to tie off the additional vas.

In the sterilization of the female, a method enthusiastically advocated by some operators is that of cauterization of the openings of the Fallopian tubes into the uterine cavity. By this method the lining or endometrium of the uterus and the tubal openings are destroyed by the actual cautery and the subsequent scar tissue

occludes the tube. It is necessary to recheck these individuals after a few months, with X-ray and other methods, to determine that the tubes are completely sealed.

Special electrodes for introduction into the uterine cavity through the vagina and uterine cervix are required.

In certain cases where surgery is impossible, because of pre-existing disease, either mental or physical, the use of X-ray or radium may be employed. These agents owe their effectiveness to the fact that by their use the germ cells of the ovaries may be destroyed and in this manner reproduction be inhibited.

A number of surgical operations on the uterus and tubes have been proposed for the purpose of sterilization. These vary from a removal of the fundus of the uterus to a simple crushing and ligation of the Fallopian tubes. All have as the basic principle a destruction of the patency of these tubes. Pregnancies have been reported following removal of the tubes, the body of the uterus and after operations of various types upon the tubes. Probably most satisfactory, because of the simplicity of technique and dependability of result, is the Pomeroy-Lull modification of the Madlener operation. In this a loop of the Fallopian tube is crushed at the base and ligated with absorbable material and the loop excised. This technique may be carried out either through an abdominal incision or by the vaginal route.

Experimental research on the value of hormones for purposes of sterilization continue. At the present time no definite accomplishment in the field of practical use of endocrine derivatives for this purpose in the human species has been established.

Stevenson, Joseph Ross

(1866–1939), U.S. theologian,

was born at Ligonier, Pa. on March 1, the son of a Presbyterian minister. He graduated from Washington and Jefferson college in 1886 and from McCormick Theological seminary, Chicago, in 1889, after which he studied for a year at the University of Berlin. Upon his return to the United States he was ordained into the Presbyterian ministry, and from 1890 to 1894 he was a pastor at Sedalia, Mo. During the next eight years he taught ecclesiastical history at McCormick Theological seminary. He was pastor of the Fifth Avenue church in New York city from 1902 to 1909, pastor of the Brown Memorial church in Baltimore from 1909 to 1914, and president of Princeton Theological seminary from 1914 until his retirement in 1936. In 1915 he was moderator of the General Assembly of the Presbyterian Church, U.S.A.; he was also president of the International Medical Missionary society and a chairman of the World Conference of Faith and Order. He died August 13 at New York city.

Stockard, Charles Rupert

(1879–1939), U.S. biologist

and anatomist, was born in Washington county, Miss., on February 27; he was educated at the Mississippi Agricultural and Mechanical college and at Columbia university, where he received his doctorate in 1906. He was granted his medical degree by the University of Wurzburg in 1922. After completing his studies at Columbia, he joined the faculty of the medical college of Cornell university and was professor of anatomy there from 1911 until his death. Dr. Stockard attracted international attention by his morphological investigations and by his experimental production of monstrosities. He died at New York city on April 7.

Stock Exchanges. During 1939 the New York Stock Exchange made a considerable number of important changes in its rules, and also undertook a series of important studies which might have an important bearing upon the future conduct of the Exchange. The most significant of these actions may be grouped under four main headings, namely, (1) changes in listing requirements, (2) changes with respect to current practice, (3) proposed changes designed for the better protection of the public and (4) special studies of certain fundamentally important subjects.

Changes in Listing Requirements.—On January 12, the Exchange announced a revision of listing fees with respect to the following: reduction of initial fee for stock from \$120 to \$50 per 10,000 shares; a 15-year annual continuing fee of \$75 per 100,000 shares for the first 2,000,000 shares, and \$50 per 100,000 shares in excess of 2,000,000; a substitution of a flat fee of \$250 per issue, in place of the existing fee of \$30 per 10,000 shares in connection with minor changes in listed stock on which the annual continuing fee is being paid; and a reduction from \$120 to \$60 per \$1,000,000 principal amount in the listing fee for short term bonds. The Exchange also announced (May 16) the establishment of "a special division to facilitate negotiations for the listing of additional securities under the revised policy announced on Nov. 22, 1938." Two additional policies were also announced, namely (1) "emphasis upon national interests and quality rather than upon size as a test of listing eligibility," and (2) to delist any stock issue whose outstanding shares available for trading have become reduced to approximately 2,000 shares, or in the case of bonds to \$200,000, par amount. On August 1 the Exchange also adopted a condensed form of listing application for companies, already having listed issues, when applying for the listing of new issues.

Important Changes with Respect to Current Practice.—Effective March 20, the Securities and Exchange Commission amended short-selling rules so as "to permit a short sale at the price of the last sale, provided the previous different price was lower than the last sale," whereas the previous rule forbade short sales to be made at or below the last regular way sale. Bona fide international arbitrage transactions were also exempted from price restrictions upon short-selling.

Rules prohibiting general partners of member firms, doing a margin business with the public, from trading on margin, were announced on January 28, effective July 15. Margin positions assumed prior to that date, however, were not required to be liquidated.

On April 13, the Committee on Public Relations announced its endeavour "to stimulate interest in advertising among member firms; that, in passing judgment upon the appropriateness of advertising, it was pursuing a liberal, realistic policy, and that its broad philosophy permitted all reasonable latitude."

Action was also taken (May 10) to classify registered employees into two general groups—"registered representatives" and "branch office managers"—instead of the previously used ten group classification. The change, it was explained, makes possible a "more intensive control" of member firms' registered employees. It is also important to note that the Exchange applies examination requirements to all classes of registered employees. On July 10 announcement was made that 2,800 securities salesmen and securities traders, employees of member firms of the Exchange, had taken "comprehensive written examination in order to qualify under the recently amended Exchange rules affecting registered employees."

Effective April 1, new rules were adopted whereby the capital requirements of member firms doing a general business with the public were increased by about 25%. Exception was made of

firms subject to supervision by State and Federal banking authorities. Under the new rules aggregate indebtedness of a member firm may not exceed 1,500% of its net capital (said capital to be not less than \$25,000), whereas previously such indebtedness was limited to 2,000% of net capital.

Proposed Changes Designed for the Better Protection of the Public.—On July 14 the president of the New York Stock Exchange appointed a public examining board "to study the broad problem of customer protection." The report of this board (rendered August 31) outlined 14 specific recommendations to enhance the protection afforded to customers by member firms. These related to increased capital requirements, enlarged auditing requirements, separating of underwriting from commission business, segregation of free credit balances, establishment of a reserve fund for the Exchange, service charges, increased Stock Exchange income, fidelity insurance for employees and perhaps for partners, minimum margins for commodity accounts and greater disclosure of financial conditions to member firms' customers. Later (September 13) the board of governors accepted the report, approved its general philosophy, and ordered that appropriate committees be assigned the duty to study the suggestions made and to make recommendations thereon. With respect to two important matters, Exchange action was taken on November 14 and December 2 respectively, namely (1) a ruling that all member firms must make available to customers "on request a statement of financial condition as of a date within four months prior to such request," and that notice of such availability must be sent to customers, and (2) the establishment of panels of 504 business and professional men in Baltimore, Md., Boston, Mass., Chicago, Ill., Los Angeles, Calif., Philadelphia, Pa., Pittsburgh, Pa., Richmond, Va., and San Francisco, Calif., from which arbitrators may be drawn in cases involving members of the public.

Studies by Special Committees of Certain Important Subjects.—Four such studies deserve special mention, namely:

- (1) A study of Federal securities legislation, involving the "desirability of equalizing competitive conditions affecting securities traded in over-the-counter and securities listed on organized exchanges."
- (2) A study in collaboration with the SEC, of the amount of stock voted at stockholders' meetings.
- (3) Report of the Washington conference of National Securities Exchanges, with respect to recommended changes in the Securities Exchange

Act of 1934 and the Securities Act of 1933. The SEC, however, opposed all the recommendations for the time being.

(4) A questionnaire study of the desirability of a membership reduction. The result showed the inexpediency of the suggestion for the present, only 40% of the membership replying to the questionnaire, and 238 opposing all forms of seat reduction.

Stocks and Bonds.—The importance of the New York Stock Exchange as a major national market is shown by the huge volume of listings of securities. For stocks on Dec. 1, 1939, such listings aggregated 1,230 separate issues, totalling 1,431,642,000 shares with a market value of \$45,505,229,000. Listed bonds, on the same date, represented 1,396 issues, with a par value of \$52,435,202,000, and a market value of \$47,839,378,000. The number of issuing corporations or governmental units totalled 851 for stock issues and 651 for bonds. Roughly speaking, the New York Stock Exchange serves as the market place for approximately one-fourth of the total wealth of the United States. Of the afore-mentioned totals, foreign stock listings on December 1 aggregated only 40,526,000 shares with a market value of \$905,549,000, while private and public bonds of foreign nations stood at \$4,565,818,000 par value, with a market value of \$2,339,138,000.

Sales of stock on the New York Stock Exchange for 1939 totalled 262,015,799 shares, and for bonds, \$2,048,237,875. For stocks the ratio of stocks to listings amounted to 1.34% for the last month for which data are available. For bonds the ratio of sales to listings for the same month amounted to 2.89%. Volume of stock sales, it will be noticed, was at a rather dull level during 1939, the stock total being 262,015,799 shares as compared with 297,000,000 for 1938, 409,000,000 for 1937, and bond sales \$2,048,237,875 as compared with \$1,859,525,825 for 1938 and \$2,790,323,300 for 1937.

Net borrowings of New York Stock Exchange members on collateral amounted to only 1.26% of the market value of listed shares on Dec. 1, 1939, whereas at the same date for 1938, 1937, 1930, 1929 and 1928, the ratios were respectively 1.35%, 1.69%, 4.06%, 6.32% and 9.66%.

With respect to the New York Curb Exchange, sales during 1939, as reported by *The New York Times*, totalled 45,800,633 shares as compared with 49,795,922 shares during 1938, 104,178,804 shares during 1937, and 134,843,049 shares during 1936. Bond sales totalled \$446,059,000 during 1939 as compared with \$367,937,000 during 1938, \$442,993,000 for 1937 and \$823,050,000 for 1936.

(S. S. H.)

TRADING IN STOCKS on the New York Stock Exchange: yearly range of prices and number of shares sold, exclusive of odd-lot and stopped sales

Stocks. The stock market of the last half of 1938 was a fairly cheerful one, although "the market rise from a percentage viewpoint, following May and June of that year, by no means represented a substantial recovery of the huge decline in dollar value occasioned by the preceding year's bear movement." The rise, however, seemed to have spent its force by the end of the year for all leading groups of stocks. Beginning in Jan. 1939, a gradual decline occurred in all directions, which continued until April when the lows of the year were recorded. Thereafter a material rise ensued for all classes of shares, which continued until the end of September.

From that time onward to the close of the year, the market was relatively stagnant with a slight and gradual decline in the average price.

Using the Babson barometer figures, the average high monthly price of 20 representative railroad stocks stood at 34.33 for Jan. 1939, as compared with 33.98 for Dec. 1938. Thereafter this price declined to a monthly high average of 27.27 for April. Following that month the average kept on improving, with certain minor exceptions, until a monthly high of 35.90 was reached during the month of September.

Dec.	30.7	..	125.8	..	62.7	..	155.5	..	100.7	..

The above figures are an average for the month based on daily closing prices.

(Source of data—Standard Trade and Securities, Statistical Bulletin—Standard Statistics Company, Inc.)

In the field of industrial stocks, using the Babson average for 30 leading issues, the average high monthly price stood at 154.85 for Jan. 1939, as compared with 154.76 for Dec. 1938. Thereafter a decline occurred which carried this monthly average down to 132.83 for April 1939. The subsequent rise brought the average to a September high of 155.92. In the case of 20 representative mining stocks the average high price for Jan. 1939 was 22.7, compared with a Dec. 1938 average of 28.94. A low average of 19.2 was reached in April 1939, and thereafter the average monthly price improved to 22.5 for September.

The Babson averages are not available at the time of this compilation for the last three months of the year. Yet the aforementioned statement of a slightly declining tendency during the last quarter of the year is confirmed by the composite statement of market values of shares furnished by the New York Stock Exchange. At the close of Sept. 20, 1939 the market value of listed shares on this Exchange stood at \$47,440,477,000. On October 31 the value was approximately the same, namely \$47,373,973,000. On November 30 the recorded value was \$45,505,229,000. December figures are not yet available but it may be stated that very little of moment occurred in the market during the last month of the year.

From the foregoing statement it will be noted that 1939 stock market movements have in no sense been sensational. The decline from January to April with respect to each of the leading groups of stocks, was just about counterbalanced by the rise from May to September. The absence of any sensational movement is probably attributable to the fact that conditions affecting business have not changed materially. The burdens of taxation upon corporations, an unbalanced national budget, a burdensome and rapidly growing indebtedness, and a governmental tendency to fight "big business" and to compete with private industry, continued as unsettling forces during 1939, just as was the case during 1938.

As regards new factors of importance, only one seems apparent, namely the outbreak of the new European war. During the first months of the year current news, in the form of possible war scares, caused a series of rather violent temporary movements. But when the war finally materialized, the stock market seemed remarkably settled. From all appearances the event was greeted as an accepted fact. A moderate rise occurred, occasionally in certain groups of stocks, like the iron and steel, the motor and aircraft groups, which were most likely to be beneficiaries of war orders. Yet this rise soon spent its force, and the market became relatively stagnant as well as constant in price. How different the 1939 stock market has been when compared with that of 1914-15. At the outbreak of the World War in 1914 all stock exchanges were closed owing to the suddenness of the shock, while during 1915 was experienced a stock market boom of extraordinary proportions. This time, however, the market experienced no shock of worthwhile proportions, nor was it followed by any rise measuring up to the proportions of a boom.

The stock market is generally regarded as a discounter of the future. Evidently, stock-market-wise, war no longer affords the speculative community the glamour that was the case at the close of 1914 and the first half of 1915. Most of the moderate rise which occurred following the outbreak of European hostilities was confined to industrials likely to profit from war orders. Thus Bethlehem Steel and United

States Steel common stocks experienced violent daily movements of as much as 17 and 9 points respectively.

Yet the gain in war stocks of this kind soon wore off, and subsequently was largely lost. The two stocks referred to reached a high of \$100 and \$82 respectively, whereas at the close of the year the quotations had declined to \$82 and \$66 respectively. Evidently the stock market this time is focussing its discounting function upon the domestic situation rather than upon international war.

Number, Volume and Amount of Stocks.—According to the New York Stock Exchange's compilation, the total of stocks listed on that Exchange on Dec. 1, 1939, stood at 1,431,642,000 shares, with a market value of \$45,505,229,000. This value compares with \$46,081,000,000 and \$40,759,000,000 at the corresponding dates of 1938 and 1937. Of this year's total, United States stocks aggregate 1,391,116,000 shares, valued at \$44,599,680,000, and foreign stocks 40,526,000 shares, valued at \$905,549,000. The total of shares was distributed over 1,210 separate American issues, and 20 foreign issues, representing a total of 851 issuing corporations.

Total shares traded on the New York Stock Exchange during 1939 amounted to 262,015,799, as compared with 297,446,059 shares in 1938; 409,468,000 in 1937; 496,063,000 shares in 1936;

TRADING IN STOCKS on the New York Stock Exchange in 1939: weekly range of prices and number of shares sold (exclusive of odd-lot and stopped sales)

and 1,124,991,000 in 1929, the largest total on record. From the standpoint of activity in sales, the 1939 market may be described as relatively dull. Rarely did daily sales exceed the 2,000,000 share market. The New York Curb Market had sales during 1939 of 45,800,633 shares. For other security exchanges of the country data were not available at the time of this compilation. But the other exchanges of the country are relatively unimportant, as regards volume of transactions, in comparison with the New York Stock and the New York Curb Exchanges. (See also STOCK EXCHANGES: *Stocks and Bonds*.) (S. S. H.)

Stone. The form in which it is produced leads to two main classifications for stone: dimension stone and crushed or broken stone. Dimension stone is used in building construction, monuments and memorials, curbing, flagstones and paving stones.

Crushed and broken stone are used mainly in concrete aggregate, road metal, railroad ballast, and riprap, besides a number of other uses dependent on the specific character of the various kinds of stone, especially with limestone and sandstone. In general, only a little over 1% of the total stone output is dimension stone, although it represents probably one-sixth of the value.

The main varieties used include basalt, granite, limestone, marble and sandstone; among the minor varieties are mica schist, argillite, volcanic rocks, boulders and serpentine. Discussion of granite and marble, and of slate will be found under the corresponding headings.

Basalt.—Trap rock, or basalt, production in the United States in 1938 was only 21,850 short tons as dimension stone, but 13,886,000 tons as crushed stone, 87% of which was used as road metal or concrete aggregate, and 4% as railroad ballast. British production of basalt is not reported separately, but is included with other igneous rocks under MARBLE AND GRANITE.

Limestone.—The production of limestone as dimension stone in the United States in 1938 declined 1%, to 704,000 short tons, valued at \$4,936,700, while crushed and broken stone decreased by 13% to 80,976,000 tons, valued at \$77,350,000. Of the dimension stone, 98% was for building stone, while 67% of the crushed stone was for concrete aggregate and road metal, 12% for metallurgical flux, 4% for railroad ballast and 5% for agriculture. These figures do not include 26,183,000 tons used in cement and 6,694,000 tons used in lime, which would give a grand total of 114,391,000 tons. Canadian limestone production decreased in 1938 by 18% to 5,533,000 short tons, valued at \$4,098,000.

The production of limestone in Great Britain in 1937 increased by 11% to 18,935,000 long tons, valued at 3s. 11d. per ton; of this total, 38% was for road metal and ballast, 30% for lime and cement, 15% for metallurgical flux and 6% for the chemical industries.

Sandstone.—The production of sandstone as a dimension stone is comparatively small in the United States, the 1938 output being 166,100 short tons, valued at \$1,473,700, a decrease of 28% from 1937; 40% of this was used in paving, curbing and flagging, and the remainder as building stone.

Sales of crushed and broken sandstone were 6,148,000 short tons, valued at \$6,593,000, a rise of 27% over 1937; of the total, 75% was used for concrete aggregate or road metal, 6% as a refractory, 3% as railroad ballast and 10% as riprap. The production of sandstone in Canada decreased 53% in 1938, to 110,170 short tons, valued at \$207,755.

Sandstone production in Great Britain in 1937 increased by 15% to 4,902,000 long tons, valued at 7s. 11d. per ton; of the total, 56% was used as road metal or ballast, 15% as a refractory, 14% as concrete aggregate and 9% as building stone.

Stones, Sharpening: see EMERY; SHARPENING STONES.

Straits Settlements is one of the three main subdivisions of British Malaya, the others being the Federated and Unfederated Malay States (*q.v.*). It includes the two main ports of Malaya, Singapore and Penang. Its subdivisions are as follows: Singapore island; Penang island; Province Wellesley; Malacca; Pangkor; Christmas island; Labuan and the Cocos islands. It is administered by a governor with an advisory council (Governor, Sir Thomas Shenton Whitelegge Thomas). The population, according to an estimate of June 30, 1938, was 1,344,545, divided, according to race, as follows: Chinese, 852,083; Malays, 301,852; Indians, 150,778; Europeans, 15,165; Eurasians, 12,641; others, 12,026. Singapore (*q.v.*) and Penang are the outlets for the rich Malayan hinterland and carry on an important export trade in tin and rubber. Straits dollar, 48.5 American cents, Oct. 1939. (W. H. CH.)

Strategic Mineral Supplies. The term "strategic" was originally applied during the World War (1914-18) to designate those materials necessary either directly or indirectly for the development of the war program, but of which the United States lacked sufficient supply to meet the demand; since supplies of these materials must be drawn from outside sources, the methods employed in maintaining the supply had to be given due consideration in the general strategy of

• Indicates the status of the mineral within the political boundaries of the home country
 ○ Indicates the status of the mineral as altered by sources under political or commercial control
 ⊙ Indicates an improved condition within the limits of the designation; e.g., an increase in the surplus, an improvement in an inadequate supply, or a change from a supply whose adequacy is questionable to one fully adequate, yet with no material surplus for export
 A=Surplus supply B=Adequate supply C=Inadequate supply D=No appreciable supply

McGraw-Hill Book Co., from *Strategic Mineral Supplies* by G. A. Roush

PRODUCTION ABILITY of the principal consuming countries for strategic minerals

the war, and hence, the materials concerned came to be known as "strategic." Later, especially in the United States, the purely military side of the term was gradually lost, and it is now quite commonly applied to designate any material the domestic supply of which is deficient.

Of these strategic materials, the minerals and metals derived from them are the most important group. When the fever for rearmament took possession of much of the world a few years back, more attention was given to strategic materials than at any time since the World War, and again with the military needs in the ascendancy. The actual existence of war always disturbs mineral production in the countries involved, and distribution to the rest of the world. The war in China had already caused some difficulties, but these were comparatively minor in both character and magnitude. With the outbreak of war in Europe the situation became more critical, not only because this had the potentiality of developing into a second World War, but also because its location and the countries involved were such as to cause a much wider disturbance in the ordinary channels of international trade, extending to countries not participating in the war, and especially to the United States. While the European war has not yet spread to the magnitude of the World War, it has been extended to include the greater portions of Europe and Asia, embracing areas that normally contribute a rather large proportion of the world's mineral supplies. Hence the present concern over the maintenance of adequate supplies, both for munitions purposes among the countries involved in the war, and for ordinary industrial purposes among those not involved.

The first of the accompanying charts presents an evaluation of the self-sufficiency of the seven major powers, that is their ability to produce within the confines of their own home area their current requirements of the more important minerals and metals that fall in the strategic classification in each of the various countries. In addition to the rating for production of the metallic ores, there is also given a rating for smelting capacity, as in most cases this differs materially. In the second chart much the same information is presented in a different form, supplemented by

data on the extent to which the home country may be able to supplement the immediate domestic supply from sources in colonial territory or from those in foreign countries but owned and controlled by domestic capital.

In interpreting the data presented in these charts there are several points that must be kept in mind. First, the data are only approximate, being based on rough averages of the status during the past few years; due to rapid changes from year to year, no attempt has been made to classify the results more closely than into the groupings of surplus, adequate, and deficient, scaling partial deficiency into thirds. Second, the ability of a country to supply its needs under the pressure of war demand may differ greatly from the conditions here indicated from past performance. Third, political or commercial control of sources of supply in colonial or foreign territory does not necessarily mean that these supplies will be available in time of emergency.

Combining the various self-sufficiency ratios in the first chart by weighting each commodity according to its relative importance gives the following factors indicating the relative ability of each country to supply its needs, on a scale of 100 for complete self-sufficiency: United States, 73; Great Britain 30; France, 33; U.S.S.R. (Russia), 76; Germany, 32; Italy, 37; Japan, 36. Again the reader should be warned that these factors apply to past performance, and may be subject to considerable alteration under war conditions; also, that they apply to conditions of self-sufficiency only, and are in no degree a measure of one country's ability to be of assistance to another.

For example, the fact that Russia is shown to have a high self-sufficiency factor does not mean that she can extend material aid to Germany in case of need, for other data indicate the contrary.

BIBLIOGRAPHY.—G. A. Roush, *Strategic Mineral Supplies* (1939); also current issues of *The Military Engineer*. (G. A. Ro.)

Strategy of the European War. Germany's invasion of Poland Sept. 1, 1939 followed by declarations of war against Germany by Britain and France caused no change in the national policies of these powers. It was simply that the point had been reached where no choice remained for each except to abandon its policy or attempt to continue it by war. These policies not only in so far as they concern the belligerents but also the neutrals constitute the basis for the war strategy of each side.

These policies date from 1935 and 1936, the years in which Germany re-established universal compulsory military service and re-occupied the Rhine, and Italy due to the imposition of Sanctions abandoned the policy in general hers since 1915 of acting in conjunction with France and Britain. The rearmament of Germany made her a desirable friend for Italy in this new orientation because her new policy put her in opposition in the Mediterranean to Britain and France, the two dominant military powers in that sea and along its African and Asiatic littoral. The result was the Rome-Berlin axis.

The Spanish Civil War showed the Germans and Italians to be acting together in the Mediterranean area, not only against British and French interests but also Russian ones. The already large and constantly increasing military strength of Italy and Germany caused France and Britain to make preparations for the defence of their interests in the whole Mediterranean area. At the same time the increasing military strength of Germany in North Europe led the Russians to lose interest in Spain and the Far East. This because the Russian military authorities knew their large but cumbersome and relatively inefficient military machine would be no match for the German one. The consequence was that French forces available for service in France against Germany before the days of the axis had to be left in Tunisia to defend the Libyan

frontier, in Syria to meet possible attack from the Italian forces in the Dodecanese islands and in the Alps along the Franco-Italian frontier. Also the British troops sent from England and India to strengthen the garrison in Egypt and the Sudan against a possible Italian attack from Abyssinia and Libya lessened the number available for service in France against the Germans. Similarly the need of both the French and British to maintain sufficient naval forces in the Mediterranean to prevent Italy cutting their lines of communication should she go to war decreased the number of ships available to escort Allied commerce and hunt down the German commerce raiders on the high seas.

While Italy did not enter the war she reaffirmed her adherence to the Rome-Berlin axis with the result that this strategical situation in the Mediterranean remained unchanged. It is a highly favourable one to Germany. Spain while neutral emphasized her ties with Italy. Therefore she cannot be completely disregarded in considering possible strategical situations in the western Mediterranean, the Bay of Biscay, and the North Atlantic off the Iberian Peninsula and Morocco.

The Rome-Berlin axis, by the military power it put back of the new orientation of Italian policy, made the first serious break in the isolation of Germany resulting from the treaties which put an end to the war of 1914-18. It opened the way to the second, which also greatly bettered Germany's strategical position, the annexation of Austria. First, it gave Germany a common frontier with Italy thus making possible the easy movement of German troops and aeroplanes to reinforce Italian troops in possible operations on the Franco-Italian frontier. Similarly reinforcement could be sent to Italian troops operating from Albania against its neighbours. Also, German air forces could reinforce Italian military forces using Libya as a base against the French in Tunisia or the British in Egypt. Similarly it put Germany in a position to threaten Italy should she break the Rome-Berlin axis. Second, it isolated Switzerland except for her western frontier with France. Third, it gave Germany a common frontier with both Yugoslavia and Hungary making them more amenable to German demands backed by the possible use of her greatly superior land and air forces. Fourth, it put Germany in a position to attack the Czech part of Czechoslovakia from three sides. The first three of these strategic advantages constitute part of Germany's strategical situation today (Jan. 1, 1940).

The next step was the elimination of Czechoslovakia. First, this subtracted from Germany's enemies in Central Europe, the 30 (approximate) infantry divisions of the Czechoslovakian Army and its air force of 500 (approximate) aeroplanes. Second, it removed any chance of either Poland or Russia in alliance with Czechoslovakia using the Bohemian salient as a jump-off position for the invasion of Germany. Third, it gave Germany a jump-off position to invade Poland from the south similar to the one she already had in the north. Fourth, just as the annexation of Austria put Germany in a favourable strategical position to advance along the south side of the Danube so did the taking over of most of Czechoslovakia put her in a favourable position to advance along the north side of the Danube. Fifth, on the strategic industrial front it gave her possession of the Skoda Arms works. Thus from the axis agreement with Italy Oct. 25, 1937, Germany steadily bettered the strategical position available in case of war.

In addition, as the result of developing the most modern method of using aviation, mechanization, and motorization in conjunction with the older type of infantry, artillery, cavalry, and transport, she was ready to strategically surprise any one of her neighbours except France, protected by the Maginot line of fortifications. (See LIGHTNING WAR; TACTICS IN THE EUROPEAN WAR.)

Taking fullest strategic advantage of both her geographical position and this force she invaded Poland Sept. 1, 1939. Great

Britain and France declared war two days later. These declarations put Germany in the same undesirable strategical situation as in 1914, that is, facing war on her western and eastern frontiers at the same time. The situation was aggravated by the possibility that Britain and France would succeed in their efforts to get Russia to join the "Peace Front." These two powers were trying to build up from the Baltic to the eastern Mediterranean.

However, Germany quickly put an end to the strategical menace of a second military and political front. From the first day of the invasion the Polish army and air force found themselves unable to resist the German invasion. As the result of an agreement with Germany, Russian troops crossed the Polish border September 17. Two days later advancing west they met the Germans coming east.

During Germany's quick campaign in Poland the French had advanced through the "no-man's" land between the French Maginot and the German Siegfried line. This movement never intended to be a serious attack was simply a diversion, to draw if possible German troops to the western front and away from the Polish one.

As soon as it was evident that the Germans were not only victorious but probably had not had to use more than 45 of the approximate 75 infantry divisions earmarked for the Polish campaign, the French terminated their diversion.

Thus Germany found herself in an excellent strategic position on land. In the south she was free from danger of attack. In the east she had no military front. She was in possession of the land and resources of the greater part of the Austrian possessions of the former Austro-Hungarian Empire. The valley of the Danube was open to her for purposes of trade. Also she was in an excellent strategic position to force its opening should one or more of the Balkan nations limit or close its trade to her. Except for that part now constituting Lithuania she had acquired practically the same territory of the former Russian Empire as that given her by the Treaty of Brest-Litovsk imposed on a beaten Russia March 3, 1918.

In addition, the Polish campaign had done no damage to her army and air force not quickly made good by the replacements of man power from depots and material from store houses.

Reliable information puts the number of properly armed, equipped, trained, and led divisions which Germany can put in the field at practically double the number France can mobilize. The number Britain has sent to France and that she will have available within a reasonable period of time is approximately one sixth the number of French divisions. This leaves Germany a surplus equal approximately to five-sixths of the French Army. It is for this reason that France adopted the defensive from the beginning of the war and has maintained it.

An attack on the German Siegfried Line (*q.v.*) during the Polish campaign could not possibly have broken through before that campaign was over. It would have cost France enormous casualties. Therefore, she would have used up a large part of her military resources without attaining the military strategical result of diverting German troops from the Polish to the Western Front. Instead she has greatly strengthened the Maginot Line (*q.v.*). This strong line of fortifications needing fewer troops than would be necessary to hold the frontier were it unfortified permits the French to do two things. The first is to form a large mobile reserve ready to go to the help of Switzerland or Holland and Belgium should they be attacked or to counter attack should the Germans decide to attack the Maginot Line and ultimately after tremendous losses break through somewhere. The second is to send back to civil life a number of their reservists mobilized in the first days of the war and thus lessen the disturbance to the normal life of the nation. This strengthens them economically and financially. The British Army and air forces already landed in France, though relatively small in numbers, help the French in both.

The stalemate which has existed on the Western Front can only be gotten around with heavy and perhaps to the attacker fatal loss; and both sides are exploring some way to bring a decision without making any such attack.

Though the British adopted conscription before the war, they had not up to the end of 1939 shown any intention to use this man power to build up the war army necessary to reinforce the French if the Allies intend to take the offensive. Until they do this the troops needed to turn the German northern flank via the Baltic, or southern via the Balkans, will not be available. The Turkish Army and air force are too small and lack sufficient modern armament to furnish this reinforcement.

Russia's unsuccessful invasion of Finland caused both Germany and the Allies to consider operations in the Nordic States each to checkmate the other in any attempt to use this territory for a flank attack. Russia's strategy is apparently based on two desires. The first is the old Tsarist one to reach the sea. The second is to put herself in the strongest position to resist possible future attack in both Europe and Asia by the capitalist powers.

At sea the strategy of the Allies has been to use every means to strangle Germany economically. This while opposing German efforts through raiding surface ships, submarines, mines, and aeroplanes to destroy the sea commerce of the Allies and the warships and aeroplanes protecting them. (See also BLOCKADE; SUBMARINE WARFARE.)

In the air the military chiefs of all belligerents have shown that a policy which saves pilots and aeroplanes for military action is considered more important than losing them in indecisive raids on cities and various activities in the rear. Up to the close of 1939 nothing decisive happened either at sea or in the air above it and the land.

Thus the year closed with no indication of whether the Allied strategy of military defensive and economic offensive or the German one of the use of armed forces to continue a policy initiated in peace will be successful.

Strikes and Lock-outs. The United States, Canada and Great Britain publish current

TEAR GAS WAS RELEASED to disperse workers at Cleveland during a strike of automotive tool and die craftsmen in July and Aug. 1939

STRIKES AND LOCK-OUTS in the United States: monthly average of man-days idle

statistics of strikes and lock-outs, their causes and results, together with detailed reports upon the more important strikes of each year. Most of the other nations report them less regularly; some not at all. The Canadian Department of Labour published a report on strikes throughout the world in the *Labour Gazette*, March 1937.

The most recent statistics then available ended in 1935 for most countries.

The present study of labour disputes in 1939 will therefore be confined to the three countries first mentioned.

The political situation in Germany, Italy, Russia and Japan has made it "inadvisable" in recent years for wage earners to undertake strikes.

There have been more strikes in the United States since 1934 than in Great Britain or Canada, both in absolute numbers and in proportion to population. Many of the American strikes have involved a large number of wage earners and been bitterly fought. But the intervention of the Government, both the Federal and some State Governments, has brought many of the strikes to an earlier conclusion.

During the first eight months of 1937, 1938, and 1939, the loss of man-days was 24,147,093, 7,162,720, and 13,765,522 respectively, but during April 1939, 4,876,744 and May 1939, 3,515,751; July 1939, also went above a million days, 1,137,025. It was the heavy man-day losses of these three months that caused the time loss on account of strikes to nearly double in 1939 the corresponding figure for 1938.

Table I—Number of Strikes, Workers Involved, and Man-Days Lost, 1933–September 1939

Monthly Labor Review, United States Bureau of Labor Statistics, Nov. 1939*

August*	136	235	371	216	155	65,000	95,000
September*	155	175	300	200	130	36,000	90,000

*Strikes involving fewer than 6 workers or lasting less than 1 day are not included in this table nor in the following tables. Notices or leads regarding strikes are obtained by the Bureau from more than 650 daily papers, labour papers, and trade journals, as well as from all Government labour boards. Letters are written to representatives of parties in the disputes asking for detailed and authentic information. Since answers to some of these letters have not yet been received, the figures given for the late months are not final. This is particularly true with regard to figures for the last 2 months, and these should be considered as preliminary estimates.

Compiled from The Ministry of Labour Gazette, February–October 1939.

Table I shows that the United States the number of strikes, workers involved and days lost, 1933–39. The year 1937 is still the record year in number of strikes since 1917. A period of relative industrial peace 1922–1932 was followed by increased strike activity.

In 1938 there were only 58% as many strikes as in 1937 and but 32% as many man-days lost as in 1937. In 1939 during the first nine months there were fewer strikes than 1938 but twice as many man-days lost. This was due entirely to the shut down of the bituminous coal mines of the Appalachian region in April and May because of conflict over the terms of a new agreement being negotiated.

Though the number of strikes in 1937 exceeded the year 1919 the number of workers involved was far less. It was not until the bituminous strike of 1939 that strikes, when measured in terms of man-days lost, were comparable in severity with those of 1919 when the number of strikers was inflated by the "great strikes" of the period—such as those in the coal mines, steel and textile mills, telephone industry of New England, the general strike at Seattle, the widespread struggles of clothing workers, longshoremen, the printing trades. In 1937 there were definite points of concentration, such as the automobile and maritime industries, but the year was characterized by labour activity "on all fronts," including retail trade, hotels, restaurants and other service industries not affected by strikes in previous years, and a large part of the strikes involved relatively small numbers of people. The years

1938 and 1939 were likewise characterized by the wide distribution of strikes, both industrially and geographically, and there were but a few outstanding disputes, like those in the maritime, automobile and coal industries.

Sit-down strikes almost disappeared as a part of the American strike picture in 1938–39. The firm position taken by the courts on the illegality of such strikes has probably eliminated them as an effective tactic of labour.

The monthly reports on strikes issued by the United States Bureau of Labor Statistics indicate that close to one-

1938	147	20,395	148,678

Canadian Labour Gazette, March 1939.

half of the strikes of 1939 involved some question of union recognition, with wages the other major issue. This distribution was characteristic of 1937, 1938 and 1939. Tables IV and V show the causes of British disputes and their results. Two contrasts with the United States situation stand out—in Table IV the absence of "union recognition" unless included in "questions involving trade union principles," and in Table V the large percentage of the strikes which ended definitely in favour of the employers.

Canada had only 97 strikes in the first nine months of 1939, involving but 39,265 workers. (See also CALIFORNIA; DETROIT; MICHIGAN; UNITED STATES.) (D. D. L.)

Submarine Warfare. England declared war on Germany on Sept. 3, 1939. Within nine hours the British liner "Athenia," bound for Canada with 1,400 passengers, was sunk 200 mi. off the Irish coast. Over 100 lives were lost. Had the submarine struck its first blow of the war? Testimony is conflicting but the world had not long to wait for proof that the under sea raider would again be used against merchant shipping. On September 6, four British steamers were sent to the bottom and a fifth was attacked by German submarines.¹

Hardly a day passed during the ensuing months without new victims being added to the toll of the submarine and the mine. In many cases it is impossible to determine whether sinkings resulted from torpedoes or mines. Even when definitely established that a ship sank after striking a mine it is difficult to determine whether or not the loss should be attributed to the submarine. As pointed out in the German official publication, *Nauticus*, the submarine is the ideal mine layer due to its ability to perform the task while submerged, thus denying to the enemy knowledge of the existence or location of mine fields.

Of the 256 merchant ships reported lost in sea warfare in the four months ending Dec. 31, 1939, it is estimated that 38% were sunk by submarines, 35% by mines, and 18% by unknown causes, which in most cases can logically be assumed to be either mines or submarines. Though the submarine has been the greatest single destroyer of ships and lives in the European war, its threat to the Allies has at no time been as great as in 1917. In April of that

year the toll of shipping losses reached 545,200 tons for the British and 881,000 tons for the world. Official British figures released in the last week of 1939 listed the war's toll of merchant ships since September 3 at 248 vessels, totalling 901,344 tons. Of the 248 ships, 126 were British, 11 French, 21 German and 90 neutral. It was estimated that Germany's submarine campaign was destroying daily 7,704 tons of shipping, only one third of the toll in the early part of 1917. German figures simultaneously released gave a total of 242 vessels of which 134 were British, 12 French, 78 neutral and 18 German.

The highest rate of sinkings directly attributable to the submarine occurred during the first three weeks of the present war when 10 ships were reported sunk the first week, 10 the second, and 15 the third. It was on September 17, during the third week, that the submarine dealt its first blow to the British fleet, sinking the aircraft carrier H.M.S. "Courageous" off the south west coast of Ireland with a loss of 515 lives. In the fourth week the submarine toll dropped to six ships and did not exceed this number in 1939 except during the 12th week, when it was eight.

The greatest single submarine victory and one of the most daring accomplishments of all submarine warfare was the sinking of the British battleship H.M.S. "Royal Oak" as it lay at anchor in Scapa Flow, Oct. 14, 1939. The hero of this achievement was Captain-Lieutenant Guenther Prien who was decorated with the Chevalier Cross of the Iron Cross Order by the German Reichsfuehrer. Eight hundred and ten officers and men lost their lives when the "Royal Oak" sank. German U-boats had made unsuccessful attempts to enter Scapa Flow in 1914, during one of which the U-18 was rammed by a patrol boat and scuttled by her crew.

The British Admiralty announced that a feat of almost equal daring was accomplished when the British submarine "Ursula" penetrated the closely guarded mouth of the Elbe river and sank a German cruiser of the "Koeln" class on December 14, 1939 although the cruiser was escorted by six destroyers. Sharing honours in the same announcement was the commanding officer of the British submarine "Salmon" who, in the words of the First Lord of the Admiralty, "rightly abstained from torpedoing the 'Bremen' when that enormous ship was at his mercy." Before encountering the "Bremen," the "Salmon" was reported to have destroyed one of the larger German U-boats, and on December 14, to have fired six torpedoes three of which made hits on two 6,000-ton German cruisers. Germany denied these claims, but if true, the British submarine service avenged the loss of the "Coura-

Warships Sunk by Enemy Action or by Mines, 1939			
Name of Ship	Tonnage	Type

geous" and "Royal Oak" during the same week when the "Exeter," "Ajax," and "Achilles" avenged the "Rawalpindi" in battle with the "Graf Spee" off Montevideo.

German submarine successes against naval vessels of the Allies have not equalled those of the first four months of 1914, when seven British men-of-war, including five cruisers, one seaplane carrier and a gunboat, were destroyed with a loss of over 1,900 lives. The submarine toll in the comparable period of the European war was 2 sunk (1 battleship and 1 aeroplane carrier) with a loss of 1,383 lives, plus damage without loss of 3 additional ships (1 battleship, 1 cruiser and 1 destroyer). A greater number of Allied men-of-war have been at sea and the number of German submarines at the beginning of the European war was 60 as compared to 28 in 1914, but the use of anti-submarine screening vessels has doubtless been largely responsible for the fewer number of naval losses. Other factors are, the improvement of sound detection devices, better depth bombs and depth bombing tactics, the greater number of aeroplanes available for anti-submarine patrol, better British mines, and the fact that at the beginning of the present conflict the submarine was known to be a weapon capable of great destruction, whereas in 1914 it was looked upon with disdain as an infant tied to the apron strings of its mother ship. Then too, the German High Command in 1914 directed its submarine effort primarily against naval objectives, not resorting to unrestricted submarine warfare against commercial vessels until Feb. 1917, whereas the undersea boats were directed against merchant shipping immediately in 1939. Other pertinent considerations are the relative naval and air strengths of the Allies and Germany in the two wars. In the first, Germany had a naval force 36% as great as the Allies compared with 11% in the present conflict. Germany was stronger in the air in both wars, but her air power through greater co-ordination with the submarine effort doubtless has compensated partially for the smaller proportion of naval force.

The effectiveness of the German submarine campaign decreased after the third week of the European war until the middle of November when the magnetic mine was employed. This weapon was probably planted by both submarines and aircraft and, in conjunction with the submarine sinkings, brought new highs in shipping losses in the weeks ending November 26 and December 17. In the latter week at least 30 vessels were sent to the bottom, an all time high for the European war, but still short of the average of 53 ships per week sunk during the unrestricted submarine warfare of 1917. In the latter part of Dec. 1939, the rate of sinkings from all causes dropped to a more normal level, despite the fact that Germany had started concentrated attack on surface ships by aircraft.

Whether or not Germany will be able to increase the rate of destruction of merchant shipping to the point which will threaten England with starvation will depend largely on the rate of destruction of submarines by the Allies and the rate at which Germany can replace her U-boats. In this connection, Mr. Churchill in an address to the House of Commons on Dec. 6, 1939, stated that German submarines were being destroyed at the rate of between two and four per week. This was estimated to be in excess of the rate at which Germany could replace U-boats with completely trained crews. A French estimate near the year's end placed the number of submarines destroyed by the Allies at 40. During the World War of 1914-18, the average number of German undersea craft destroyed during the entire war period was 3.42 per month, and the largest number in any one month was 14, in May 1918. The average for 1918 was 6.4 per month, but during this period Germany had an average of 124 submarines or about twice the number on hand at the beginning of the European war in 1939. In view of the fact that the submarine can sink below the surface without necessarily being destroyed, it is probable that a

number of those reported destroyed are still in operation.

The rate at which Germany can turn out replacement submarines depends largely on the size boat on which she standardizes. During 1914, the average monthly rate of completion of U-boats was 2.2. This increased to 4.3 in 1915, to 9 in 1916, and then decreased to 7.3 for 1917 and 8.5 for 1918. The largest number produced in any one month from 1914 to 1918 was 15 in Dec. 1916. Had the war lasted the German Admiralty planned to reach a rate of one submarine per day by July 1919. The boats actually built during 1914 and 1918 were larger than any of the three German types now in service. These are: oceangoing, 740 tons, 6 torpedo tubes, 4 forward and 2 aft; seagoing, 500 tons, 5 torpedo tubes, 4 forward and 1 aft; and coastal, 250 tons, 3 torpedo tubes. Germany built 24 of this latter type during 1935 and 1936 and conceivably could build them on a mass production basis as reported. The smaller type of submarine not only lends itself more readily to mass production but requires fewer men to operate, the 250 ton boat taking a crew of 23 as compared to 40 for the 740 ton type.

The problem of training replacement crews is not as great as during the war of 1914. The Germans have perfected submarine training devices for use on land. One of these machines provides the means of developing the skill of the commanding officer in making a successful attack on a zigzagging target making changes in speed. Another so accurately simulates the action of a submarine under various conditions of trim and diving plane angles as to provide very good training for the diving officer and crew. Similar devices are used at the submarine training school at New London, Connecticut.

In 1918 the final outcome rested on the decision at sea. It may be so again. In 1917 the submarine very nearly won that decision. It did not fail because of Germany's inability to replace submarines and crews as fast as they were destroyed. The failure was instead due primarily to the great reduction in losses of Allied shipping incident to the success of the convoy system.

At the beginning of the European war the combined merchant fleets of the Allies aggregated 23,936,000 tons. Thus far the rate at which this tonnage has been destroyed has not reached the proportions of 1917. It remains to be seen whether this rate can be raised to the critical point by Germany's acceleration of submarine replacement and utilization of her air force to assist the submarine in commerce destruction. There must also be considered any additions to her submarine fleet which Germany may obtain from possible allies. Still another factor is the measure of the effect of Germany's understanding with Russia in nullifying the Allied blockade. (See also SHIPPING, MERCHANT MARINE.)

The outcome is not certain but it is clear that the submarine will play a major role. It is a vessel which is cylindrical in cross section at its mid-length and tapers down in diameter toward both ends. It is usually divided into six watertight compartments by transverse bulkheads. The bow compartment is the torpedo room and has the torpedo tubes in its forward part with their axes parallel to the axis of the boat. These tubes have doors at both ends which are capable of manual operation from within the compartment. When the torpedo is to be loaded in the tube the door at the outer end is closed and the inner door opened. The inner door is then closed and the outer door opened when it is desired to fire the torpedo. A shutter or movable section of the bow is also moved clear of the torpedo path by means of gear operated from within the torpedo room. The torpedo is projected from the tube by compressed air suddenly admitted to the after end of the tube and acting on the conically shaped after section of the torpedo.

The second compartment from forward is the forward battery

*Sunk before start of Finnish-Russian war (except one Finnish ship exploded by mine in North sea).

†Ships of less than 100 tons computed at 50 tons.

is located for operating the ship when submerged. Air and water valves are here arranged in manifolds which admit of the transfer of water ballast from one part of the ship to the other or for admitting or expelling water from trimming tanks as required to adjust the buoyancy and trim. Here are also located the control mechanisms for steering the ship, manipulating the diving planes, opening and closing the flood and vent valves used in diving or surfacing the boat, the telegraphs for indicating desired changes of speed, and the periscope with which observations are made while submerged.

Above the control room is the conning tower and on top of that the navigating bridge from which the ship is conned when on the surface.

In the conning tower there is usually a steering control station and a periscope.

The fourth compartment aft is the after battery room similar to the forward except that the ship's galley or kitchen and the crew's living accommodations are located here.

The next compartment aft contains the Diesel engines which propel the ship on the surface and furnish the power for charging the batteries. The engines cannot be run while the boat is sealed for a dive because of the great volume of air which they require.

The aftermost compartment is the motor room in which are located the large motors for submerged propulsion and miscellaneous auxiliary machinery such as pumps and air compressors. In case the submarine is one which has an after torpedo room this equipment is located in the other compartments, the main motors being in the after part of the engine room.

On top of the submarine proper is a non-watertight superstructure which provides a level deck space and at the same time protects the large hull and battery ventilation piping which runs outside of and just above the pressure hull.

The periscopes can be run up and down like an elevator but the upper end must be above the water to see anything.

Submarine speeds on the surface vary for different boats between 12 and 21 knots. Submerged speeds are between 7 and 10 knots. Cruising radii for small boats are as low as 1,000 mi. and for large ones as high as 16,000 miles. All submarines must run while submerged to maintain depth control by the utilization of forces impressed on their diving planes or fins by the reaction of water on their surfaces.

Water pressure increases about .4 of a pound per square inch per foot depth, hence there is a definite limit below which any given submarine cannot go without crushing its hull. This depth varies for different types from about 250 ft. to 350 feet. Provided they do not exceed this depth submarines can lie on the bottom until their contained air becomes too high in carbon dioxide content or too deficient in oxygen. This depends on the size of the boat, number of men, amount of carbon dioxide reducing chemical carried and the number of oxygen flasks available. It is usually at least two days.

The submarine carries one or more guns on deck but its primary weapon is the torpedo. This is a cylindrical self propelling projectile usually about 21 in. in diameter and about 20 ft. long with a rounded nose and a conical shaped tail. The explosive charge of from 400 to 500 lb. is contained in the forward section. Propulsion is either by steam turbines or reciprocating engines which drive two propellers on concentric shafts. Air at high pressure is converted into steam before reaching the driving engines. The torpedo steers itself and controls its depth by means of two pairs of rudders, one vertical and the other horizontal, mounted on vanes at the after end. The mechanism is started by a lever which is forced aft as the torpedo moves out of the tube.

Torpedoes cost about \$3,000 each. They may be fired from under the water or on the surface and explode upon striking their target.

It was not until Sept. 5, 1914 that a submarine, German U-21, sank a warship with a self-propelled torpedo. Not until early 1917 was the submarine used in unrestricted warfare on merchant shipping. Nearly 400 warships and several thousand merchant ships have since been sent to the bottom by submarines with the loss of thousands of lives. There are now in the world over 700 of the undersea warcraft and more are being built now than at any previous time. Ton for ton the submarine has become the most dreaded destroyer which plies the seas. (See also BLOCKADE; INTERNATIONAL LAW; NAVIES OF THE WORLD; TACTICS IN THE EUROPEAN WAR.)

Sugar. A substantial increase in sugar production was general in 1939 despite delay in harvesting the sugar beet crops in belligerent countries because of labour shortage occasioned by the war. In the United States beet sugar production declined slightly and was estimated by the Department of Agriculture as 1,607,000 short tons, for 1939, and cane sugar at 511,000 short tons. Production in 1938 was 1,685,000 short tons of beet sugar and 583,000 short tons of cane sugar. The 1939 and 1938 production of beet sugar in other leading producing countries was estimated by the International Institute of Agriculture as follows; all in short tons:

	1939	1938		1939	1938
Germany . . .	2,000,000	2,350,000	Rumania . . .	190,000	184,000
U.S.S.R. . . .	2,600,000	2,400,000	Yugoslavia . . .	141,000	95,000
France . . .	1,138,920	921,277	Hungary . . .	140,000	140,337
United Kingdom	605,500	370,348	Spain . . .	122,000*	100,000
Bohemia, Moravia & Slovakia	599,480	579,228	Turkey . . .	105,000	56,000
Italy . . .	515,000	438,400	Ireland . . .	69,700	66,679
Poland . . .	470,000	602,000	Japan . . .	56,732	54,789
Sweden . . .	337,000	322,290	Latvia . . .	40,000	41,000
Belgium . . .	300,000	211,838	Bulgaria . . .	39,000	23,790
Netherlands . . .	259,000	226,040	Lithuania . . .	30,000	22,003
Denmark . . .	250,000	201,304	Finland . . .	17,000	16,826
			Switzerland . . .	16,300	15,000

*Licht's estimate

In Canada production of sugar beets in 1939 was estimated at 628,000 tons and 527,000 tons in 1938. In the United States the 1939 crop of sugar beets was 10,691,000 short tons compared to 11,615,000 short tons in 1938. Production of beet sugar in the United States in 1939 and 1938 by States was as follows, in short tons:

	1939	1938		1939	1938
California . . .	436,000	337,000	Nebraska . . .	102,000	135,000
Colorado . . .	262,000	309,000	Utah . . .	100,000	111,000
Michigan . . .	160,000	171,000	Wyoming . . .	84,000	106,000
Montana . . .	138,000	142,000	Ohio . . .	40,000	43,000
Idaho . . .	129,000	143,000	Other States . . .	156,000	188,000

Cane sugar production in the United States in 1939 and 1938 and the ten-year (1928-37) average was as follows, by States:

	1939	1938	Average 1928-37
Louisiana . . .	433,000	491,000	250,000
Florida . . .	78,000	92,000	32,000

Molasses produced, including blackstrap, from sugar cane was estimated at 33,891,000 gals. in Louisiana in 1939 and 38,891,000 gals. in 1938. In Florida, 4,784,000 gals. in 1939 and 5,497,000 gals. in 1938. Sugar cane harvested for sugar in Louisiana in 1939 was estimated at 5,805,000 short tons, compared to 6,741,000 short tons in 1938 and a ten-year (1928-37) average of 3,609,000 short tons. In Florida, 736,000 short tons in 1939 and 882,000 in 1938, with a ten-year average of 382,000 short tons. The ten-year average of sugar (beet) production in the United States is 8,486,000 short tons. Production of beet pulp in the United States in 1939, in 1938 and the ten-year (1928-37) average was estimated by the Department of Agriculture as follows, in short tons:

	1939	1938	Average 1928-37
Moist pulp . . .	1,019,000	1,858,000	1,428,000
Molasses pulp . . .	158,000	210,000	120,000
Dried pulp . . .	98,000	105,000	82,000

(S. O. R.)

Suicide Statistics. During the period 1935-37, there was an annual average of 14.5 deaths from suicide per 100,000 of total population in the United States; for England and Wales, the corresponding death rate was 12.6. The highest death rates from suicide in recent years were found in Austria, 38.7; Czecho-Slovakia, 27.8; Germany 28.3; Hungary, 31.5; and Switzerland, 26.0. Suicide death rates were lowest in Eire, 3.1; Northern Ireland, 4.4; and in Spain before the civil war, 4.3.

White persons in the United States are much more prone to suicide than are Negroes, the death rates per 100,000 in 1937 being 16.1 and 4.8 respectively. Among white persons, males, with a death rate of 24.5 per 100,000, are much more liable to suicide than females, who had a death rate of 7.5 per 100,000. There is, on the whole, a marked increase in suicide incidence with advancing age.

It has been generally observed that suicide, particularly among males, tends to become more frequent when economic conditions are low, and to decrease in frequency as conditions improve. There is also a seasonal incidence in suicide, with the greatest number occurring in spring and early summer, and the fewest in winter. Suicide is usually more prevalent in urban than in rural communities. In regard to social economic status there is some evidence to indicate that suicide is most frequent in both the highest and lowest classes.

Average Annual Death Rates from Suicide per 100,000 total population in certain countries for specified periods of years

Country	Period	Death Rates per 100,000	Country	Period	Death Rates per 100,000
Austria	1934-36	38.7	Ireland, Northern .	1935-37	4.4
Australia	1935-37	11.3	Italy	1935-37	7.7
Belgium	1934-36	16.9	Japan	1934-36	21.3
Bulgaria	1934-36	9.2	Lithuania	1934-36	8.4
Canada	1935-37	8.5	Netherlands	1935-37	8.0

Sulphur. The United States is the outstanding sulphur producer of the world, with about three-quarters of the entire output; Italy is a poor second, with one-sixth, and Japan third with one-fifteenth; all other producers are so small as to be negligible so far as the world industry is concerned, although the production may serve to satisfy local needs.

World production reached almost 3,000,000 metric tons in 1929, dropped to 1,625,000 tons in 1932, and recovered to the former level in 1937. Italian production has remained with little change during recent years, while that of Japan has been increasing. United States production rose to a new high record of 2,742,000 long tons in 1937, decreasing to 2,393,400 tons in 1938; shipments declined even more heavily, and stocks of 4,200,000 tons have accumulated at the mines. Exports in 1938 were 588,664 tons, chiefly to Canada, United Kingdom, Australia and Germany.

(G. A. RO.)

Sumatra, which lies north-west of Java and which, along its north-western coast, is closely adjacent to the Malay peninsula, is after Java the most important and after Borneo the largest of the Sunda islands. Its area is 163,145 sq.mi.; population (1930) 8,238,570. It is almost bisected by the Equator, lying between 5° 4' North and 5° 59' South. It contains a long mountain range called the Bukit Barisan ("array of mountains"), of which Mount Indrapura has an elevation of 13,700ft. and Mount Ophir of 10,483 feet. Sumatra is less advanced and less economically developed than Java, but enjoys the same rights of representation in the Volksraad. The island possesses both agricultural and mineral resources. Native agricultural production is mainly devoted to rice cultivation, although Sumatra is not self-

sufficient in rice and depends to some extent on imports from abroad. Rubber and coffee are the main products of the European plantations. Government coal mines in Sumatra yielded an output of about 830,000 tons in 1928. The output of crude oil in the same year was about 880,000 tons. Limited amounts of gold and silver are also mined. Sumatra at the end of 1937 had 1,233mi. of rail and tramway lines and 15,600mi. of highways.

Sun: see ASTRONOMY.

Sunday Schools. The World's Sunday School Association is a federation of 51 national and international bodies interested in Christian religious education through the Sunday school and allied agencies. At Oslo, in 1936, a survey reported 369,510 Sunday schools in 129 countries, with 3,145,895 teachers and 34,139,624 scholars. There are no Sunday schools in Russia and Turkey.

The conference held at Madras in Dec. 1938 under the auspices of the International Missionary Council, to consider the world mission of the church, urged "the continual enrichment of the Sunday school in the teaching program of the church." Significant developments during 1939 were the youth leaders' convention of the National Council of Religious Education of Australia, a national youth congress fostered by the National Council of Evangelical Churches of Mexico, the organization of a Council for Christian Education in Iran, the growth of the "Zoe" Sunday schools in Greece, the inauguration of evangelical radio broadcasting in Brazil, a religious education institute in Burma, the meeting of the Bible Lands Union for Christian Education at Choueir on Mount Lebanon, and the appointment of an educational secretary for the Congo Protestant Council.

A new ruling of the Ministry of Education in China permits religious instruction and worship in private schools, students being free to attend and participate as they choose. The National Committee for Christian Religious Education in China has organized a strong West China section and is vigorously furthering its program, with especial emphasis upon training for lay service.

War conditions have hampered the work of the Sunday schools in Europe, especially where children have been evacuated from cities; and it has practically ceased in Austria, Czecho-Slovakia and Poland. The world Sunday school convention planned to be held in Durban, South Africa in 1940 has been indefinitely postponed. A Pan-American Sunday school convention will be held in Mexico in 1941.

(L. A. WE.)

Sunshine: see METEOROLOGY.

Super, Charles William (1842-1939), U.S. educator, was born at Pottsville, Pa. on September 12. After completing his education in America and Germany he became professor of languages at Cincinnati Wesleyan college, then professor of Greek at Ohio university, Athens, Ohio. He was acting president of Ohio university from 1883 to 1884 and president from 1884 to 1901. Among his works are *Between Heathenism and Christianity* (1899), *A Liberal Education* (1907), and *Pan-Prussianism* (1918). He died at Athens, Ohio on October 9.

Superphosphates. The bulk of the phosphate rock output of the world is used in the production of superphosphates for fertilizer manufacture, of which there are three standard grades, containing 16%, 32% and 45% of available phosphoric acid. World production of superphosphates is of the order of 16,000,000 metric tons, as compared with 12,000,000 tons of phosphate rock. The chief producing countries and their

percentages of the total are as follows: United States 25%; Japan 13%; Italy 9%; France 9%; Australia 8%; U.S.S.R. (Russia) 8%; Germany 7%; and Netherlands 3%; totalling 82%. Intermediate producers, ranging from 500,000 tons down to 100,000 tons, include New Zealand, Denmark, Belgium, Spain, Sweden, Poland, South Africa, and Latvia, totalling 16%. The remaining 3% is scattered among 14 minor countries. United States production in 1938 was 3,575,000 short tons, a drop of 19% from 1937, increasing to an estimated 3,800,000 tons in 1939. In 1938 about 55% of the phosphate rock output was used in the production of superphosphates and 34% exported; assuming that a similar proportion of the exports also went into superphosphates, the total so used would be about three-quarters of phosphate rock output.

(G. A. Ro.)

Supreme Court of the United States.

The term has differed in vital aspects from prior terms. The reconstruction of the membership of the court and the disposition of the reconstructed court to re-examine doctrines formerly regarded as entrenched have introduced no small measure of uncertainty into the law.

Two more justices were appointed by the President in 1939, Felix Frankfurter, long a professor of law at Harvard, to succeed the late and widely lamented Benjamin Nathan Cardozo, and William O. Douglas, Chairman of the SEC, and formerly professor of law at Yale to succeed the eminent Louis D. Brandeis, resigned. The loss to the bench of Cardozo and Brandeis is inestimable. Their influence will endure wherever the genius of law is invoked. With the appointment of Frank Murphy (Attorney-General) on Jan. 4, 1940 to succeed the late Pierce Butler, President Roosevelt has selected a majority of the Supreme Court.

Administrative Law.—The most significant aspect of developments in Administrative Law has been the enlargement of the scope of the judicial review, to include "negative" as well as "affirmative" orders of commissions (*Rochester Telephone Corp. v. U.S.*, 307 U.S. 125). It has affirmed a Circuit Court of Appeals ruling that it would review the Federal Power Commission's denial of an application for approval of the transfer of properties of one electric power company to another (*Federal Power Com. v. Pacific Power and Light Co.*, 307 U.S. 156).

Civil Rights.—The Supreme Court gave evidence of carefully scrutinizing the activities of local and Federal governmental agencies in their relationships with the people and of protecting the latter from encroachments upon their civil rights by the former. In four important opinions the court championed the cause of the people against oppression by instrumentalities of the State. In the first of these, the judgment of the highest court of the State of Missouri was reversed, and it was decided that denial of admission to a Negro who desired to attend the law school of the University of Missouri constituted a violation of the 14th Amendment (*Gaines, State of Missouri ex rel. v. Canada*, 305 U.S. 337). In another case it was held to be beyond the power of the Department of Labor for that agency to attempt to deport an alien whose membership in the Communist Party had ceased to be effective before he was apprehended (*Kessler v. Strecker*, 307 U.S. 22). The third case saw an act of the Oklahoma Legislature invalidated because it tended to restrict Negroes in the exercise of their right to vote (*Lane v. Wilson*, 307 U.S. 268). Finally, it was held that the mayor and other officials of Jersey City, N.J., had violated the rights of citizens to freedom of speech and of assembly by enacting and enforcing certain ordinances allegedly intended to preserve the peace (*Hague v. C.I.O.*, 307 U.S. 496). In two other decisions it denounced wire-tapping evidence. In one it resolved the conflict of views growing out of the court's ruling in 1937 that evidence of interstate communications obtained by tapping wires is inadmissible in view of the Communications Act of 1934. The same rule is now applied to intrastate messages. The statute is construed to prohibit the interception of all communications (*Nardone v. U.S.*, 307 U.S. 614). In the other case the court holds that the rule is not applicable solely to messages but extends also to information obtained through the use of intercepted conversations (*Weiss v. U.S.*, 307 U.S. 621).

Constitutional Law.—The court discussed points of constitutional law pertaining to regulation of intoxicating liquors, labour relations, marketing of agricultural commodities, motor carriers, the privilege of engaging in business, public utilities, taxation of incomes, transfer of decedents' property and the use of personal property. The court decided 20 cases on due process of law, 18 on commerce clause, 8 on equal protection of the laws, 4 on full faith and credit clause, 7 on dual sovereignty, 4 on jurisdiction of Federal courts, 3 on contract clause, 3 on delegation of legislative power, 3 on amendment of the Constitution, 2 on 21st Amendment, and one each on privileges and immunities, compensation of judiciary, ex post facto laws, 2nd amendment, 4th amendment, 6th amendment, and 15th amendment.

THE SUPREME COURT IN 1939. In the front row, left to right, are Associate Justices Stone and McReynolds, Chief Justice Hughes, Associate Justices Butler (deceased, November 16) and Roberts; rear row, Associate Justices Frankfurter, Black, Reed, and Douglas

In a case involving the power of States to erect interstate trade barriers to protect or benefit home industries, the court held unconstitutional a Florida statute providing for inspection of imported cement and the payment of an inspection fee of 15¢ a hundred pounds (*Hale v. Bimco Trading, Inc.*, 306 U.S. 375). The purpose of the statute, admittedly to encourage the use of the domestic product, was held an unconstitutional burden on interstate commerce. On the other hand, the court sanctioned the applicability of a "use" tax to the use and storage in a State of equipment purchased in other States by interstate railroad and telephone companies (*Pacific Tel. and Tel. Co. v. Gallagher*, 306 U.S. 182). In other cases involving interstate trade barriers, the court sustained anti-discrimination acts of Missouri (*Joseph S. Finch & Co. v. McKittrick*, 305 U.S. 395) and Michigan (*Indianapolis Brewing Co. Inc. v. Liquor Control Commission of the State of Michigan*, 305 U.S. 391) prohibiting the importation into and the sale in such States of liquor manufactured in other States discriminating against liquor manufactured in Missouri and Michigan. The statutes, frequently described as "retaliation" statutes, were held valid under the 21st Amendment over the objection that such amendment could not be construed to sanction State regulation of the liquor traffic which is designed as "an economic weapon of retaliation."

Labour.—In labour the court rendered some of its most significant decisions. In one which attracted wide public attention, the court set forth its first pronouncement regarding a sit-down strike. It held that an employer had the right to discharge employees who had taken possession of its buildings in the course of a sit-down strike, even though the strike might have been directly caused by an unfair labour practice. The opinion lays down the further rule that strikers who aid sit-down strikers are likewise guilty of unlawful conduct and are in no better position than the sit-down strikers themselves, insofar as the employer's right to discharge them is concerned (*NLRB v. Fansteel Metallurgical Corp.*, 305 U.S. 590). Breach of a contract by the employees justified the employer's refusal to bargain collectively (*NLRB v. Sands Mfg. Co.*, 305 U.S. 586); and where the union gave no indication of desire to negotiate, the employer cannot be charged with refusal to bargain collectively (*NLRB v. Columbia Enameling and Stamping Co., Inc.*, 305 U.S. 583). The jurisdiction of the board was extended to the unfair labour practices of an intrastate utility company (*Consolidated Edison Co. v. NLRB*, 305 U.S. 197); and a garment manufacturer operating on a small scale (*NLRB v. Fainblatt*, 307 U.S. 609).

Taxation.—In an epoch-making decision the Supreme Court overruled the ancient doctrine of inter-governmental tax immunity, and held that a State may tax the salary of an employee of the Home Owners' Loan Corporation. Doubt no longer remains but that the Federal Government can tax the salaries of State employees (*Graves v. O'Keefe, New York ex rel.*, 306 U.S. 466; *State Tax Commissioners of Utah v. Van Calt*, 306 U.S. 511). California's use tax on a utility was upheld as merely an incident of intrastate business and not a tax for the privilege of doing interstate business, which tax would be illegal (*Southern Pacific Co. v. Gallagher*, 306 U.S. 167; *Pacific Telephone and Telegraph Co. v. Gallagher*, 306 U.S. 182). Tax for the use of a State highway (*Dixie Ohio Express Co. v. State Revenue Commission*, 306 U.S. 72) or caravanning (*Clark v. Paul Gray, Inc.*, 306 U.S. 583), i.e. driving or towing cars into State for purposes of sale, was also upheld.

Trade Regulation.—Measures in regulation of trade have been encouraged by further judicial sanction of the widening scope of the commerce clause. In a series of agricultural marketing cases the court gave effect to the "stream" or "current" of commerce theory. It upheld the Tobacco Inspection Act regulating auction sales in tobacco warehouses located in the State of the production of the tobacco, over the contention that the sales constituted intrastate transactions immune from Federal regulation, on the theory that, because much of the tobacco was purchased for interstate transportation, the sales of the tobacco constituted a part of the interstate commerce therein (*Currin v. Wallace*, 306 U.S. 1). The same theory was invoked to sustain, as an exercise of the commerce power, the Agricultural Marketing Agreement Act of 1937 and milk marketing orders issued by the Secretary of Agriculture under the statute. In two decisions (*U.S. v. Rack Royal Cooperative*, 307 U.S. 533; *Hood and Sans v. U.S.*, 307 U.S. 588) the court upheld price fixing in the New York metropolitan area and

the Boston area on the ground that sales of milk by producers to handlers operating in the same State are transactions in interstate commerce where the milk is purchased for delivery in another State, and that, as to milk consumed in the same State as that in which it was produced and sold, the intrastate transaction is subject to Federal regulation to make effective the regulation of the interstate commerce. (See also *TENNESSEE VALLEY AUTHORITY*; *UNITED STATES: Supreme Court.*) (B. WE.)

Surgery. Most valuable among developments in surgery during 1939 has been the use of sulphamylamide and sulphapyridine for the control of postoperative infections. More recently, as a result of the researches of Barlow, a more potent substance, sulphamethylthiazol, has been developed. This can be taken by the patient without nausea in spite of the increased potency of the drug over sulphapyridine. The destruction of staphylococci by this drug, even when they are in the blood stream, is amazing.

The use of vitamins, particularly vitamins B, K and C as replacement or substitution therapy, both in the preoperative and postoperative management of patients whose vitamin deficiency has been the result of certain gastro-intestinal diseases, has reached a pinnacle.

The tendency of the jaundiced patient to bleed has been definitely shown to depend on a deficiency of prothrombin in the circulating blood, which, in turn, is due to a failure in the absorption of the fat-soluble vitamin K from the intestinal tract. Deficiency in the absorption of this substance will depend partly on exclusion of bile from the intestine and partly on injury to the liver, which interferes with the normal formation of the prothrombin. By administering concentrates of vitamin K and bile salts to jaundiced individuals it is possible to restore the concentration of prothrombin to normal and to prevent or correct the haemorrhagic diathesis.

The existence of vitamin K was first noted in 1935. It is a matter of some interest that the structural formula for two naturally occurring forms of this vitamin is already known and that these substances have been prepared synthetically; K-1 (derived from alfalfa) is 2-methyl-3-phytyl-1,4-naphthoquinone, and K-2 (derived from fish meal) is 2,3-difarnesyl-1,4-naphthoquinone. The vitamin has a quinoid structure and a number of simple naphthoquinone derivatives have been shown to have antihæmorrhagic activity comparable to pure synthetic vitamin K. Among these may be mentioned phthiocol (2-methyl-3-hydroxy-1,4-naphthoquinone) and 2-methyl-1,4-naphthoquinone. The former compound is of some biologic interest since it was first isolated from the pigment of *Mycobacterium tuberculosis*. Since vitamin K is probably formed in considerable quantities in the mammalian intestine by bacterial activity, the isolation of the antihæmorrhagic quinone from a bacillus becomes of considerable physiologic significance. The substance 2-methyl-1,4-naphthoquinone is extremely potent in respect to its antihæmorrhagic properties and will doubtless serve as a unit for the measurement of the activity of vitamin K.

Lund and others have called attention to the value of preoperative and postoperative administration of vitamin C to all patients whose gastric function has been disturbed as the result of abnormal lesions, such as ulcer or carcinoma, especially those whose preoperative diets have been deficient in vitamins.

Of further interest in replacement therapy has been the ability successfully to transplant beneath the skin crystalline substances similar in action to the adrenal cortex. This has been effective in prolonging life in cases of Addison's disease, in which various degrees of suprarenal insufficiency are present.

A recent report stated that the transplantation of ovarian tissue from one woman to another has been used in 45 cases and that excessive ovarian tissue was removed from patients with hypermenorrhoea and transplanted into patients with hypomenorrhoea. This procedure is definitely still in the experimental stage.

Encouraging progress is being made in our knowledge of hor-

mones. Methods are being developed for the assay of the hormonal content of blood and urine. These methods should aid in the diagnosis of certain gynaecologic and testicular conditions, such as chorioepithelioma, arrhenoblastoma and teratoma. Hormones, either natural or synthetic, are now available for the treatment of such conditions as senile vaginitis and kraurosis vulvi and for replacement therapy in cases in which these hormones are lacking either because of disease or following the surgical removal of diseased, but functioning, glandular tissue.

The outstanding advance in the field of plastic surgery during 1939 was the presentation by Padgett and Hood of their ingenious device for cutting large skin grafts. With this apparatus a liquid adhesive is used to cause the skin, from which the graft is to be taken, to adhere to a cylindrical drum. As the drum is rotated an adjustable knife, working parallel to the surface of the drum, cuts a graft of any thickness desired. The securing of grafts of uniform thickness is thus rendered largely mechanical.

Further experience with preserved isocartilage (that is, cartilage removed at necropsy or from a living individual other than the patient) has clearly demonstrated the advantage of such grafts over those of autoplasmic type (grafts taken from the patient himself); it also has demonstrated their limitations. Isocartilage appears to be definitely more resistant to infection than does cartilage freshly removed from the patient's own rib (homocartilage) but an appreciable amount of absorption of isografts occurs, particularly in the presence of infection. Isocartilage should never be used until it has remained in the germicidal preserving solution for a sufficient period of time to insure sterilization, usually about two weeks. Moreover, cultures of the cartilage should be made routinely prior to use. Failure to observe these precautionary measures may result in severe infection and necessitate removal of the graft.

Investigative work of the American Academy of Orthopedic Surgery concerning the treatment of fractures of the neck of the femur by operation and fixation with metal nails or screws has been carefully done and has conclusively proved the advantages of this method over the conservative treatment with casts alone.

A new metal, called Vitallium has been introduced. This may be used for plates, pins, and screws in fracture work. It is composed of chromium, cobalt and molybdenum and contains no iron. This metal has been used for many years in dentistry, and has been found to have the least electrolytic reaction of any of the metals. It is also being used in arthroplasty of the hip, that is, to make a cup to cover the end of the femur which is placed in the remade or new acetabulum. This metal seems to cause no reaction on the part of the tissues and is tolerated better than any other metal that can be used.

An operation has been described for growths situated low in the sigmoid, in the rectosigmoid, or high in the rectum; the principal feature of this operation is radical removal of the growth and the adjacent lymph nodes, with preservation of the anus. Subsequent procedures are designed to re-establish the rectal continuity.

The conservative surgical treatment of large staghorn stones in the kidney is now accomplished satisfactorily and with low operative risk. Previously many of these stones have been allowed to remain in place until obstruction, hæmorrhage and renal insufficiency developed, and cure of the patient was then very difficult or impossible.

Total removal of the bladder preceded by bilateral transplantation of the ureters, preferably into the bowel but occasionally into the skin, can now be accomplished for certain cases of extensive and otherwise inoperable carcinoma of the bladder, in which the operation is indicated, with a very reasonable operative risk.

The peritoneoscope has been generally accepted throughout the U.S. in the last two years and now every large medical centre has

at least one man using the instrument. It has a definite field of usefulness; it permits visual inspection of certain intra-abdominal structures through a small opening not more than 1 or 1.5 cm. in diameter. (See also MEDICINE.)

Surinam (DUTCH GUIANA), a colony of the Netherlands in north-eastern South America; area, 54,291 sq.mi.; language, Dutch; capital, Paramaribo (pop. 52,760), governor, Dr. J. C. Kielstra. The population on Jan. 1, 1939, was 152,589, besides an estimated 17,000 bush Negroes and 3,500 Indians in the jungle. The chief city is Paramaribo. In 1937, 29.2% of the population was British Indian, 20.3% Netherlands Indian, in national-ity. The colony has an appointed governor and an elected council. There are 137 km. of railroad, and fairly good roads in the coastal district. External communication is by steamship and bi-weekly air service. On Sept. 4, 1939, a regular air service to Curaçao was inaugurated by the Royal Dutch Airlines. Imports, chiefly manufactured products and foodstuffs, totalled 6,866,542 florins in 1937 (Netherlands, 38%; United States, 22.4%); exports were 7,613,210 florins (United States, 64.2%; Netherlands, 22.5%). Bauxite, to the United States, represented nearly 64% of the export value. Imports in 1938 were 6,861,756 florins, exports 6,609,139 florins. In 1938 bauxite production was 377,213 tons, a nominal decline. Other important export products are: gold (440,231 gr. produced in 1938), sugar, coffee, molasses and rice. Government expenditure in 1938 was 6,506,644 florins, with revenue only 3,721,863 florins, necessitating a Netherlands Government subsidy to cover the deficit. The monetary unit is the florin (value: approx. 53½ cents U.S.). Surinam has 132 schools (43 Government), with 21,851 enrolment in 1939, besides 33 Indian and bush Negro schools in the jungle. (L. W. BE.)

Swanson, Claude Augustus (1862–1939), U.S. secretary of the Navy, was born at Swansonville, Va., on March 31. After graduating from high school he taught for a year to secure funds for further study. He attended Virginia Polytechnic Institute, worked again for two years as a grocer's clerk, then finished his undergraduate course at Randolph-Macon college in 1885. The next year he received his degree in law at the University of Virginia, was admitted to the bar, and began practice at Chatham, Virginia. His first venture into national politics was successful when, in 1893, he was elected to the U.S. House of Representatives. From 1906 to 1910 he was governor of Virginia and from 1910 to 1933 U.S. senator from that State. He was appointed chairman of the Senate's naval affairs committee in 1918 and had acquired an expert's knowledge of the U.S. Navy when President Roosevelt appointed him to the cabinet in 1933. When he took office as secretary of the Navy, the United States had only 17 warships building. When he died at Rapidan camp, Va., on July 7, the naval forces had been increased by 197 ships either built or under construction. In his six years as secretary he had directed the largest peace-time expansion of naval forces in American history. Swanson believed sincerely in disarmament—at the 1932 Geneva conference he called the submarine a "sea assassin" and urged its proscription—but once the world began rearming he resolved that the United States should have "the greatest navy afloat."

Swaziland: see BRITISH SOUTH AFRICA.

Sweden, area 173,347 sq.mi.; pop. (est. Dec. 31, 1937) 6,310,214. Chief towns (pop. est. Dec. 31, 1937): Stockholm (570,771), Göteborg (275,753), Malmö (151,247), Norrköping (69,737). Ruler: King Gustav V; language: Swedish; religion: Lutheran Christian.

History.—In the budget presented to the Riksdag on Jan. 11, 1939, 238,500,000 kronor, out of a total of 1,363,500,000 kr., was allocated to defence; on March 28 an extraordinary estimate of 66,550,000 kr. was added; on September 9 a supplementary estimate of 360,000,000 kr. was introduced; on September 30 the Government asked for 1,000,000 kronor to provide paravanes for the protection of steamships against mines; and on October 21 supplementary credits amounting to about £22,300,000 were voted for national defence. In May the period of service for conscripts was raised from 200 to 340 days. At a meeting in Stockholm of the foreign ministers of Sweden, Norway, Denmark and Finland on May 9 it was declared that "The Northern countries, as hitbertos, remain outside all groups of powers that may be formed in Europe, and in the event of war will do everything to avoid being involved." In September, after the outbreak of war, a list of export embargoes, including scrap iron, was published; a War Commerce Bill was drafted forbidding individuals to incur obligations towards foreign powers; and, as a result of these measures and of the danger to neutral ships from war action, it was stated that Swedish shipping had been brought almost to a standstill. The sinking by the Germans, on September 28, of the "Nyland," a neutral ship bound for a neutral port, was the subject of a strong protest to the German Government. On October 18–19 King Gustav met the Kings of Norway and Denmark and the President of Finland in Stockholm, and in a broadcast to the nation reiterated the determination of the northern countries to maintain their neutrality. In November representations were made to the British Government against her blockade of exports from Germany. Late in the year, when the Russian attack on Finland developed, Sweden's sympathy for Finland combined with her anxiety concerning her own future led to the opening in Stockholm of a recruiting office for volunteers for the Finnish Army, and many thousands of Swedes offered their services. Partial mobilization was ordered on December 5, and on December 27 General Thoernell, the chief of staff, was appointed commander-in-chief of the armed forces. On December 2 the communist journals *Ny Dag* and *Arbetartidningen* were suppressed. A British trade mission visited Stockholm in April, and on December 27 an Anglo-Swedish trade agreement was announced. (E. A. ASH.)

Education 1937.—Elementary, number of scholars 587,000; secondary, number of scholars 59,000.

Defence Forces 1939.—The army consisted of 1,780 officers, 7,282 N.C.O's and men, and an annual contingent of about 14,300 conscripts. Navy and coast artillery, 450 officers, 4,960 N.C.O's and men, and an annual contingent of about 4,900 conscripts; air force, 255 officers, 175 N.C.O's, 1,015 enlisted men, and an annual contingent of 2,370 conscripts.

Banking and Finance.—Revenue, ordinary (est. 1938–39) 1,294,670,000 kronor; expenditure, ordinary (est. 1938–39) 1,294,670,000 kronor; budget estimate, ordinary (1939–40) 1,363,100,000 kronor; public debt (June 30, 1939) 2,633,617,000 kronor; notes in circulation (June 30, 1939) 1,059,000,000 kronor; gold reserve (June 30, 1939) 763,800,000 kronor; exchange rate (Aug. 31, 1939) 17½–18¼ kronor=£1 sterling.

Trade and Communication.—Foreign trade (merchandise): imports (1938): 2,081,910,000 kronor; (Jan.–Aug. 1939) 1,559,100,000 kronor; exports (1938) 1,843,539,000 kronor; (Jan.–Aug. 1939) 1,193,100,000 kronor. Communications and transport: roads, main (Jan. 1, 1939) 52,996 mi.; railways, open to traffic (Jan. 1, 1939) 10,486 mi.; airways, distance flown (1938) 1,316,-

074mi.; shipping (June 30, 1938) 1,575,700 gross tons; launched (July 1938–June 1939) 175,200 gross tons; motor vehicles licensed (Dec. 31, 1938), cars 219,201; motorcycles 43,551; wireless receiving set licences 1,226,858; telephone subscribers 788,000.

SWEDEN: Industrial production index (The Annalist)

Production of sweet potatoes in the United States in 1939 was estimated at 76,122,000bu., or 1% under the 1938 crop of 76,647,000bu. and 8% above the ten-year average (1928–37) of 70,690,000 bushels. Production by States in 1939 and 1938 was:

Sweet Potatoes. Production of sweet potatoes in the United States in 1939 was estimated at 76,122,000bu., or 1% under the 1938 crop of 76,647,000bu. and 8% above the ten-year average (1928–37) of 70,690,000 bushels. Production by States in 1939 and 1938 was:

	1939 bu.	1938 bu.		1939 bu.	1938 bu.
Georgia	9,840,000	9,225,000	Kentucky . . .	1,886,000	2,280,000
Alabama	8,774,000	8,500,000	California . .	1,380,000	1,521,000
North Carolina .	8,667,000	8,748,000	Florida	1,240,000	1,400,000
Mississippi . . .	7,740,000	7,743,000	Maryland . . .	1,200,000	1,040,000
Louisiana	7,592,000	6,030,000	Oklahoma . . .	1,100,000	1,470,000
South Carolina .	6,900,000	6,468,000	Missouri	1,020,000	1,020,000
Tennessee	4,335,000	5,459,000	Delaware . . .	700,000	500,000
Virginia	4,114,000	3,570,000	Illinois	564,000	648,000

Arkansas	2,800,000	3,225,000	Iowa	300,000	300,000
New Jersey . . .	2,025,000	1,470,000	Kansas	240,000	375,000

(See also POTATOES.)

(S. O. R.)

Swimming. Foremost feats in 1939 were the international record exploits of Richard H. Hough, of the United States, and the Misses Ragnhild Hveger and Inge Sørensen, of Denmark.

Hough bettered three breast stroke standards, at his best clipping the time for 100yd. from 1min. 2-1sec. to 1min. 6/10sec. and 100 metres from 1min. 9-5sec. to 1min. 7-3 seconds. Miss Hveger, now the holder of all but one of 16 free style records listed for women, among others cut the figures for 100yd. from 59-8sec. to 59-7sec. and 500 metres from 6min. 39-1sec. to 6min. 34-3 seconds. Miss Sørensen lowered the breast stroke marks for 400 metres from 6min. 19-2sec. to 6min. 16-2sec. and 500 metres from 8min. 1-9sec. to 7min. 58 seconds. An occurrence of moment was the first defeat suffered by a Hungarian national water polo team since 1928. The Magyars, winners at the last three Olympiads, succumbed to Germany in the tournament for the Horthy Trophy. The score was 2 goals to 1.

A significant feature was the great number of competitive tours undertaken by national teams. In Europe, up to the outbreak of war in September intercountry swimming meets and water polo matches were more frequent than ever, Germany displaying supremacy in the men's field and Denmark in the women's.

The Japanese invaded Manila to triumph in the championships of the Philippines; Australians engaged in a conquering trip

through South Africa; United States squads gained the lion's share of the laurels at carnivals in Argentina, Ecuador, and Cuba; a group of Hawaiians gained their first team victory in the outdoor championships of the United States, outscoring all mainland teams. (L. DE B. H.)

Swing Music: see DANCE; MUSIC, POPULAR.

Switzerland, area 15,944 sq.mi.; pop. (est. Dec. 31, 1938) 4,194,600. Chief towns (pop. Dec. 31, 1938): Berne (cap. 121,976), Zürich (329,780), Basle (162,559), Geneva (123,286), Lausanne (89,632). Government, Federal Council of seven members; president (Jan. 1, 1940), Dr. M. Pilet-Golaz; languages (census 1930), German 2,924,000; French 831,000; Italian 242,000, other 69,000; religion, Protestant 2,330,000; Roman Catholic 1,666,000.

History.—The results of the general election in October were as follows (previous figures in brackets):—Government Coalition: Radical Democrats 50 (48); Catholic Conservatives 44 (42); Farmers, Traders and Citizens 21 (21); Other Parties: Liberal Democrats 6 (6); Independent Party 9 (7); Young Farmers and Free Democrats 6 (7); Social Democratic Party 45 (50); Dissident Socialists 4 (0); Communists 0 (2); No Party 2 (4). On December 13 Marcel Pilet-Golaz, head of the posts and railway department, was elected president of the Swiss Federation for 1940. He had been president in 1934.

Various measures to strengthen the country's defences were taken during 1939, such as raising the age of liability to military service from 48 to 60 (April 5), lengthening the period of military training (February 2), and the establishment of compulsory service for all civilians (September 5). In March military precautions were taken all along the frontier; on August 29 full mobilization of the frontier forces was decreed, and on the next day Col. Henri Guisan was appointed commander-in-chief of the army, a post which does not exist in peace time. In April, replying to Germany's inquiry concerning President Roosevelt's message, the Government said they knew nothing in advance of that message and that they "place their confidence in the respect of Swiss neutrality, which the Confederation will defend with its army, and which Germany . . . has expressly recognized."

Among the outstanding events of the year were: the arrest on the Grùsh Alp on February 14 of two German frontier guards who were pursuing two Austrians into Swiss territory; and the expulsion from the Social Democratic Party on September 16 of M. Léon Nicole, the extreme Leftist leader. (E. A. ASH.)

Education.—In 1938: elementary 464,714 scholars; secondary 86,190 scholars; university 11,472 students.

Banking and Finance (Confederation).—Revenue, ordinary (1938) 539,005,000 francs; (est. 1939) 511,800,000 francs; expenditure, ordinary (1938) 578,011,000 francs; (est. 1939) 600,700,000 francs; public debt (Jan. 1, 1939, exclg. rlys.) 2,753,315,000 francs; notes in circulation (July 15, 1939) 1,694,987,595 francs; gold reserve (July 15, 1939) 2,466,089,651 francs; exchange rate (average 1938) 21-37 francs=£1 sterling; (Aug. 31, 1939) 18-65–19-45 francs=£1 sterling.

Trade and Communication.—Foreign trade (merchandise); imports (1938) 1,606,903,000 francs; (Jan.–Aug. 1939) 1,167,810,000 francs; exports (1938) 1,316,572,000 francs; (Jan.–Aug. 1939) 998,740,000 francs. Communications and transport: roads suitable for motor traffic (1939) 28,030mi.; railways open to traffic (1939) 3,690mi.; airways (1938): passengers 75,937; goods carried 1,235 metric tons; motor vehicles licensed, 124,195; wireless receiving set licences, 548,533; telephone subscribers, 450,380.

Agriculture and Labour.—Production 1938 (in metric tons): milk 2,860,000; wheat 212,400, (1939) 173,100; potatoes 823,000;

SWISS INFANTRYMAN on mountainside manoeuvre in 1939

beet sugar 93,100; rye 36,800, (1939) 32,700; oats 25,400, (1939) 25,600; cheese 52,600; butter 30,500. Labour: index of employment (1929=100) (average 1938) 77.9; (June 30, 1939) 82.1; unemployed (average 1938): wholly 8.6%; (June 30, 1939): wholly 4.4%; number unemployed (average 1938) 65,583.

Table Tennis. European power politics laid a disrupting hand on international table tennis in 1939. Three leading nations in the sport—Austria, Czecho-Slovakia and Poland—have disappeared from the map, while in Hungary, the home of champions, that nation's famous team was broken up and its members scattered to foreign lands. In the 13th world championship tournament, held in March in Cairo, Egypt, under patronage of King Farouk and Queen Farida, Richard Bergmann (Austrian exile in England) won back the men's singles title from Bohumil Vana (Czecho-Slovakia), and Vlasa Depetrisova (Czecho-Slovakia) dethroned Trude Pritzi (Germany) in the women's singles at about the time Miss Pritzi's homeland was moving to dismember Miss Depetrisova's country. Victor Barna (Hungary), and Bergmann won the men's doubles, undefended by Jimmy McClure and Sol Schiff (U.S.A.), the holders. Hilde Bussmann and Miss Pritzi (Germany) won the women's doubles; Vana and Vera Volubcova (Czecho-Slovakia) won the mixed doubles. The Swaythling Cup for men's teams went to Hungary, the Corbillon Cup for women's teams to Germany. In the U.S.A., McClure won the national men's championship and Emily Fuller re-

tained her women's title, at Toledo. New York kept its grip on the national team title and Princeton university won the Bradley Trophy among the college teams. Outbreak of war in Europe caused cancellation by the International Table Tennis Federation of the 14th world championships scheduled for the Stade de Coubertin in Paris in Feb. 1940, and a shifting of table tennis activity to the U.S.A., Australia and New Zealand. There were no changes in the playing rules, but in the U.S.A. there was stricter enforcement of rules against "pushing" (purely defensive tactics).

Tactics in the European War.

On land, at sea, and in the air the tactics used successfully in the European war have proved that today, as in the past, Napoleon's dictum, "fire is everything," still holds. In other words, other factors, such as leadership, organization, training, discipline and supply being the same, victory goes to the side which delivers the most damaging fire while most successfully resisting the enemy's fire. The development of high speed in the sky, on the ground and at sea has not changed this.

What has happened in the war to the end of 1939 may be summed up as follows:

1. Where armies fight in the open, those units win victory which make the smallest targets while doing the most damage to the enemy by their own fire.

2. The more an army fortifies itself so that it can successfully resist enemy fire, the more the attacker must develop his own fire to succeed. That is, he must have more cannon, of bigger calibre, firing shells with bigger bursting charges than would be true if he were attacking the same enemy in the open.

3. Ships at sea to survive and win must have the fire power to destroy or drive off enemy surface ships, airships, and submarines. They must have the construction and armour necessary to withstand enemy shells, bombs, and torpedoes.

4. Aeroplanes being unable to carry sufficient armour to survive hits from enemy's fire attempt to escape it by having enough speed to insure they only being within range for a very short time. In other words, they are fleeting targets. The consequence of this speed is that their own target is within the range of their own weapons such a short time, they have only a fleeting opportunity effectively to fire on it. Also their own speed diminishes their accuracy and therefore their chance of hitting the target during the fleeting opportunity given them.

In so far as the infantry, cavalry and artillery are concerned there has been no drastic change in tactics. The infantry has a greater deployment in depth than during the war of 1914-18; it makes a greater use of mortars and howitzers because of their high angle fire. It still survives enemy's fire, because the individual infantry soldier lying down is a small target and scattered by the thousands over a wide area is difficult to hit. Cavalry which has not yet learned to carry the same rifle as the infantry and to use automatic pistols, has but limited use and promptly suffers defeat at the hands of properly armed horsed cavalry and mechanized forces. The artillery is even more important than in the World War (1914-18), because infantry and cavalry are more dependent upon it than was true during that war. Its tactics are based on the principle of quickly furnishing crushing fire against any enemy target which holds up its own infantry or cavalry or which can stop its own tanks and aviation from giving proper support to the infantry and cavalry. The greatest change in tactics results from the great increase in numbers and use of motorcycles, armoured cars, tanks of all kinds and aviation.

In general, where an attempt is made to use any or all of these without adequate support of infantry, horsed cavalry and above all artillery, failure results. This because all are very vulnerable to enemy fire. First, because they are large targets by comparison with infantry or cavalry soldiers. Second, because they must come out in the open and cannot be hidden in the folds of the ground, as is true of batteries of artillery. Third, because they are unarmoured or lightly armoured. Even the most heavily

armoured tanks cannot resist artillery fire.

Prior to the war of 1914-18, the general conviction was that permanent fortifications on land, except perhaps as a pivot for troops in the open, were things of the past. However, the resisting power of field fortifications and of some of the old French permanent forts during the war of 1914-18 led the French to build the Maginot line, a deep zone of steel and concrete. Opposite it the Germans have built the Siegfried line, a deep zone of steel and concrete. In each case, and in particular in the case of the Siegfried line, the tactical principle followed is that of independent units scattered both in width and depth in such a way as to lend each other mutual support by their fire and prevent the capture of any one, or a group from opening a gap through the fortified zone. (See also MAGINOT LINE; SIEGFRIED LINE.)

To make any attack more difficult the rearmost part of the defences are out of range of the heaviest guns which could be brought to bear on the fortifications in front of them. Thus, a complete capture of all fortifications within range of the heavy guns of the attackers would not open a breach from front to rear of the fortified zone. Before the balance could be captured the heavy artillery would have to be moved forward and the whole process repeated. It is probable that at the present time this would have to be done three times before a complete break could be made.

Along with this fire of the heavy artillery would have to go the fire of lighter artillery and the slow advance of infantry, probably by the old slow siege methods. This consists of digging trenches in the front called "saps" from which other trenches parallel to the front called "parallels" are dug, each one farther forward than the last. The last parallel is the jumping off place for the infantry assault. Mining and counter mining would inevitably be necessary.

The other fortified lines in Europe are much less strong and probably could be broken through by the ordinary methods of attack with heavy artillery support.

Up to the end of 1939 aviation had not been used on a large scale to bomb cities, industrial plants, and in general the civilian activities of the rear. The probabilities are that, aside from humanitarian reasons, it is generally considered in military circles that such bombardments cannot have decisive results. On the other hand, the maximum number of aeroplanes is needed for the strategical and tactical support of troops on the ground, where decisive results can be obtained. Undoubtedly another factor is the tremendous improvement in anti-aircraft artillery. It is only when this artillery has been crushed or silenced by the ordinary artillery that aviation can operate with reasonable security against ground targets. (See also AIR FORCES.)

Germany, like Italy, has developed the use of transport planes to carry infantry and machine guns from the rear quickly to points just out of enemy artillery range, where they are disembarked and used to reinforce troops already engaged. The use of parachute infantry and machine guns tried out by the Russians in Finland failed, as was expected by professional military people the world over. In combat in the air, as in the World War of 1914-18, the pursuit plane is still necessary to protect the bombers from attack. At sea, aeroplane attacks by bombing from high altitudes and by diving have been made on warships of various categories, including submarines, and upon merchant ships. Where the planes have not had to meet an accurate anti-aircraft gunfire and where the target has not been sufficiently armoured to withstand these attacks, they have been successful. The tactics of submarines have not changed since the war of 1914-18.

Mine fields of anchored mines are still being used for protective purposes off seacoasts, as barbed wire is used on shore, to keep an enemy at a distance. Mines dropped by aeroplanes have made their appearance. They have proven effective.

In the combat of warship v. warship, there is nothing new. The ship with the heaviest gun power and sufficient armour to withstand enemy shells is victorious. The action of the "Graf Spee" off the Uruguayan coast proved this. With her 11 in. guns, as long as they were in action, she badly battered an 8 in. gun cruiser and kept two 6 in. gun cruisers at a distance. However, her armour was insufficient to resist the fire of the 8 in. enemy guns, with the consequence that her fire control for at least some of her 11 in. guns was destroyed. This lack of armour was due to the fact that her tonnage was limited to 10,000 tons. Therefore, she could not carry 11 in. guns and sufficient armour and have the speed which she possessed. The tonnage limitation prevented this. In other words, like Lord Fisher's battle cruisers of the war of 1914-18, protection through adequate armour having been sacrificed to guns and speed, disaster in battle was the result. (See BLOCKADE; NAVIES OF THE WORLD; SUBMARINE WARFARE.)

The importance of correct tactics coupled with first class armament, training, and leadership, is shown by the difference between Germany's highly successful campaign in Poland and Russia's unsuccessful campaign against Finland. Tangier. An international territory, Tangier is one of the zones of Morocco, its legislative power being vested in an international assembly following the Convention of Paris of Dec. 18, 1923. The regime is autonomous, under the nominal sovereignty of the Sultan of Morocco, with France the paramount power. The Sultan's representative is the Mendoub, Sidi Mehemmed Et-Tazi. Area 225 sq.mi.; pop. (est. Dec. 31, 1938) 60,000. Chief town (cap.) Tangier (pop. 45,000). Administrator: M. Le Fur; languages, official: Arabic, French, and Spanish; religion: mainly Mohammedan. Trade, external (1938) imports 94,693,830 francs; exports 11,380,286 francs. Finance: revenue (1938) 26,262,981 fr., (est. 1939) 29,795,500 fr.; expenditure (1938) 27,732,709 fr., (est. 1939) 29,547,359 fr.; public debt (est. 1939) 9,566,548 fr.

In April it was reported that many Italian soldiers, dressed as civilians, had entered the zone, and that some thousands of Spanish Falangists were receiving military instruction from them.

Tannery, Jean (1878-1939), French financier, born on December 31, began his career as an attaché in the ministry of public works and advanced through various banking positions until he was appointed, in Jan. 1935, governor of the Bank of France. During his régime he secured the co-operation of the United States and Great Britain in establishing stability of international exchange. When Léon Blum formed his Popular Front cabinet, he "promoted" Tannery, in June 1936, to honorary governorship of the bank. Tannery died at Paris on July 7.

Tariffs. Tariffs have relatively lost ground since 1937, and other kinds of restrictions have gained. Japan has progressively tightened her war economy, practically excluding imports for general consumption. Austria had almost eliminated its exchange control, but during 1938 was incorporated in the German system of State control of trade, as were the Sudetenland and

Memel. The rest of Czechoslovakia followed. Albania was swallowed in a customs union with Italy in April 1939, and in September Polish trade came under the German and Soviet state controls. Ecuador re-established a system of import licences; Belgium and Chile have extended their quota systems, and so on. Even without examining the spread of clearing and compensation agreements, tariffs appeared relatively less important on Sept. 1, 1939 than in 1937, though probably up to the outbreak of war between Germany and the United Kingdom, France and Poland, the trade admitted free of duty or subject to no restriction other than tariffs, surtaxes and excises still considerably exceeded that subject to additional methods of control.

The recovery from the depression of 1929-33 had proceeded far enough by 1937 that the commercial policies of most countries were relatively stable. Tariff adjustments since 1937 were unimportant in comparison with the years 1930-1933. There were about the same number of decrees and agreements relating to tariff rates and other control measures, but an increasing proportion of them related to prolongation of quota systems and renewals of short-term agreements of various types, and usually with little or no change. Tariff changes were numerous, but minor adjustments of little significance predominated.

Significant tariff reductions have been, however, embodied in the trade agreements of the United States, notably in those with the United Kingdom and with Canada, effective Jan. 1, 1939. The Canadian agreement revised that of three years earlier, both parties making wider and deeper tariff reductions. The United States also reduced certain rates in agreements with Ecuador, Turkey and Venezuela, effective respectively Oct. 23, 1938, May 5 and Dec. 16, 1939, obtaining reciprocal concessions from those countries. An agreement with Cuba, effective Dec. 23, 1939, was important mainly in restoring United States concessions on Cuban sugar and tobacco, concessions made in 1934 but later suspended in connection with changes in domestic agricultural controls. Negotiations have been announced with Belgium (for revision of the agreement of 1935) and with Argentina, Uruguay and Chile.

Beginning with 1937 commercial policies in Europe have been largely dominated by war and preparation for war. This background meant greater efforts at self-sufficiency and the limitation of non-essential imports both directly and by reducing purchasing power by higher taxes. Some of the most important economic agreements had political and military objectives, such as the three British agreements with Rumania, Sept. 2, 1938, May 11 and July 12, 1939, and such as the German-Soviet agreement of August, and the German-Rumanian agreement of Dec. 1939.

In general, the movement was rather slowly and uncertainly but definitely in the direction of higher tariffs, more State control of trade, and bilateral balancing of trade. The totalitarian states make military self-sufficiency a definite goal. Industrial states seek to stimulate their agriculture, and agricultural states desire to build up manufactures. In some states the movement progresses by deliberate national policy, in others through the political influence of farmers and other groups of producers who obtain governmental support for their interests.

On Dec. 8, 1938 and Sept. 15, 1939 Australia raised many rates of duty at least under the general as distinct from the preferential schedule applicable to imports from British Empire countries. South Africa raised some tariff rates on June 22, 1939. New Zealand's exchange control and licensing system of Dec. 7, 1938 was explained by the prime minister as a permanent policy intended to cushion the country from depressions abroad. The licensing system has been used to prohibit imports, e.g. of complete motor cars, and to stop the importation of various non-British products which had in some degree surmounted the very high differentials of the preferential tariff.

An act of Jan. 7, 1939 empowered the Government of the Netherlands to afford "moderate protection" to local industries and many tariff rates were raised effective March 1 and July 10. Belgium increased numerous tariff rates and extended quota restrictions. The Government of India revised the Ottawa agreement with the United Kingdom, abolishing many of the preferential reductions and also reducing the general tariff rates on many articles from 30% or 35% to 25% ad valorem. Minor changes in other countries are too numerous to mention.

War in Europe.—The war which broke out in Europe on September 1 produced for some countries maximum and for others minimum changes in commercial policies. For several years Germany had operated under a strict war economy and large scale military operations required a minimum of change in commercial regulations. An office was established to supervise importation, exportation, and domestic sale of forestry and wood products; and ration cards for meats, fats and oils, milk, sugar, coffee, cereal products and eggs were introduced on August 27. The important fact was the sudden stoppage of trade with England and France rather than any alteration of commercial policy or of the machinery for the state control of trade.

On the other hand, in Britain, France and some neutral countries the outbreak of war produced (or offered an excuse for) maximum change in state control of trade and national economy and deeply affected commercial policy. The tendency was for this war to start where the last one stopped. The British started the World War (1914-18) with the slogan "Business as usual." This war began with widespread application of state control over both foreign and domestic trade. For two years in advance the Food (Defence Plans) Department had been developing its war plans, and controls of leading commodities and industries were rapidly instituted. Within a few days, the war economy was almost as closely organized as in 1918 at the end of four years of war. Enforcement of specific measures began as soon as the war appeared inevitable, although exchange control was not established until September 3. On September 4 the Food Ministry undertook to control imports and stocks of foodstuffs and the prices of some staples, and on September 5 many imports were made subject to licence. The rationing of foodstuffs, however, was postponed until Jan. 8, 1940.

For Britain the war regime has moved drastically in the direction of self-sufficiency and Empire preference. Importation of many products designated as luxuries has been prohibited, although in certain cases licences may be given even for such luxuries as embroidery, gramophones and crystallized fruit. The American tobacco market was disorganized by prompt refusal of foreign exchange for the purchase of tobacco, and from Jan. 1, 1940 all licences for import of tobacco are to be withheld.

The war control has temporarily counteracted a number of the concessions contained in British trade agreements both by substituting prohibitions for tariff reductions and by re-establishing Empire preference in a more effective form. Embargoes have been placed on the exportation of extensive lists of foodstuffs, raw materials and manufactures. Separate control offices have been set up for iron and steel, non-ferrous metals, aluminium, coal, wool, silk and rayon, hemp, flax, jute, leather and hides, paper, timber, molasses and industrial alcohols, dyestuffs, mercury and compounds, machine tools, toluene and cotton. To November 17 the Cotton Control was only collecting data; most of the other controls were regulating exports or imports or both (as well as fixing prices, allotting supplies, etc.).

War control measures began before the war. In Britain the Priority Committee was set up on August 3. On August 24 many metals and some oils were embargoed and the Bank's discount rate was doubled; and in the next two days steps were taken toward

the control of agriculture and the mobilization of foreign securities. In France an embargo was imposed on exportation of war materials on August 15 and on August 28 many raw materials and manufactures were embargoed. War measures, particularly embargoes on exportation of certain foodstuffs and raw materials, were taken by Belgium, Denmark, Norway, Sweden, Egypt and Turkey during the last week of August.

On September 2 the French established a licence system for all imports, and on September 10 a general system of exchange control.

Throughout the British and French Empires, the various dominions and colonies generally followed the lead of the mother countries, though with various delays. Australia, however, instituted exchange control five days ahead of Britain, and New Zealand had established a general licence system and exchange control on Dec. 7, 1938. The measures employed were usually exchange control, licensing of imports, and licensing of exports, but in some places the licences were not required for all products.

The effect of the outbreak of war either on the belligerents or on the neutrals was reflected in only a minor degree in changes of tariff rates. The total number of changes since the first of September is considerable, but not much more than normal. Many of the rates seem to reflect the need of additional revenue, and mineral oils, liquors, tobacco and coffee, already heavily taxed, have had further burdens imposed on them. Italy has prohibited the sale of coffee, and Hungary imposed a permit tax of 200% of the retail price of tea and coffee. Great Britain increased the duty on tobacco by 2s. per pound (in addition to the 2s. of April 1939), the total duty now being equivalent to some 1,500% ad valorem. On the other hand, the belligerents have removed or reduced tariff rates upon some necessities. For example, the United Kingdom has exempted pig iron, aluminium and certain alloys and manufactures of aluminium. France exempted horses and mules and beans and reduced the tax on rubber.

The outbreak of war was the presumable cause of rapid extension of state control over trade in neutral countries. Most widespread was the introduction of embargoes and licensing systems for the restriction of exports. Almost every country in Europe and some others restricted or embargoed the exportation of longer or shorter lists of foodstuffs, raw materials, and even in some cases manufactured articles. Eire, Finland and Egypt introduced exchange control and in some countries exchange controls became more rigid.

In the first weeks of September Peru, Haiti, Nicaragua and Estonia gave their Governments wide powers to control imports and exports and aspects of the domestic economy. In Brazil the National Economic Defence Council is to control imports and exports and regulate the supply of goods for internal consumption. The Federal Council of Switzerland has established a War Economy Syndicate for foodstuffs and has authorized other syndicates. Almost daily during the first half of September, the Netherlands instituted governmental control of some industry or other. Canada, however, did not establish exchange control until September 15, and the coal administrator was not appointed until October 18, although a sugar administrator had been appointed much earlier.

A number of the neutral countries, notably Greece and Nicaragua, subjected imports to licence systems. The Netherlands has established a monopoly to control imports of fish and fish products; Spain, a monopoly for scrap iron and steel; Ireland, for wheat and corn; and Greece, for sugar, coffee, dried vegetables, and codfish. The Netherlands renewed on October 5 a previous monopoly control of milk, butter, cheese and casein.

The trade agreements of the United States with Canada and with the United Kingdom, effective Jan. 1, 1939, gave the year 1939 a good start in stimulating international trade; but can one

entertain hope that the movement will go very far in the face of growing international difficulties of a political nature? The example set by these notable trade agreements has not been followed to any great extent, and even before the outbreak of war in Europe, the year 1939 saw more raising than lowering of trade barriers. The year closed with wars in Europe as well as in Asia, and probably less freedom of commerce than at any time since 1918. The trade agreement program of the United States is under such attack that some now predict its discontinuance. Nonetheless, this war will terminate, and among the millions compelled to ponder the possibility of establishing a stable and lasting peace, an increasing number are impressed by the necessity of restoring an ample and secure international trade. (See also TRADE AGREEMENTS.)

(B. B. W.)

Tasmania, area 26,215 sq.mi.; pop. (est. March 1939) 238,061. Chief towns: Hobart (cap., 64,950); Launceston (33,100). Governor: Sir Ernest Clark. A State of the Australian Commonwealth.

History.—The State suffered a severe loss in the sudden death of the Labour premier, A. G. Ogilvie, on June 10, after a notable career in public life. He had been at one time the youngest K.C. in the British Empire. Mr. Dwyer-Gray, the treasurer, succeeded him as premier without portfolio. Mr. Cosgrove was appointed deputy leader and treasurer, and delegated to succeed Mr. Dwyer-Gray in Jan. 1940; T. D'Alton became minister for agriculture, and E. Brooker chief secretary and minister for transport.

At its conference in April, the Labour party again urged introduction of compulsory military training. The budget revealed a deficit of £25,984 for the financial year 1938-39, and estimated a deficit of £57,754 for 1939-40. Pastoral and agricultural areas were less seriously affected than the mainland States by the adverse season, and stock remained in good condition. Work began at Boyer on the erection of a new paper mill, and plans were prepared for the development of iron ore deposits near Burnie, and for the establishment of magnesium works. Good progress was made with the pontoon bridge across the Derwent at Hobart.

(L. R. Mc.)

Finance.—Revenue (1938-39), £3,639,494; expenditure £3,635,999; public debt (June 30, 1938), £25,840,807.

Communications.—Dec. 31, 1937: roads, surfaced 21,000 mi.; railways: Government 663 mi.; private 131 miles. Motor vehicles licensed (Dec. 31, 1938): cars 16,648; trucks 4,511; cycles 3,646. Wireless receiving set licences (Dec. 31, 1938) 36,013. Telephones, subscribers (1937-38) 13,482.

Industries.—Production 1937-38: primary £8,032,000; secondary £5,445,000. Labour, 1937-38 average: factory employment 13,170 employees; unemployment (Trade Union returns) 7%.

Tatsch, Jacob Hugo (1888-1939), American Masonic leader and author, was born in Milwaukee on January 29. After spending 17 years (1905-22) in various banking positions at Spokane, New York city, Boston and Los Angeles he became in 1923 assistant secretary and assistant editor of the National Masonic Research society at Cedar Rapids, Iowa. The rest of his life was spent in a study of the Masonic movement, and he was the author and co-author of 11 volumes on the history of Freemasonry and biographies of several of its prominent leaders. During the World War he was a special agent for the Military Intelligence division of the U.S.A. and in 1935 he was promoted to lieutenant-colonel in the U.S. Army. He died at London on July 17.

Taxation. In the United States the most striking development since 1938 has been the comparative cessa-

tion of new taxing legislation, on the part of both Federal and State Governments. In the former field this was indicated by the absence of new taxes and of increases in existing taxes; by the final repeal of the undistributed profits tax of 1936; and by the refusal of the 76th Congress to adopt measures for broadening the income tax base or other new tax proposals.

In the field of State legislation no new sales, or chain store taxes have been enacted since 1938. In sales tax legislation, however, there has been a considerable tendency toward detailed revision of existing sales taxes, taking the form sometimes of expansion, sometimes of restriction, of the scope of commodities and services subject to the tax, and sometimes of the adoption of "use" taxes to prevent evasion of existing sales taxes.

The one most active field of State taxation throughout 1939 has been that of cigarette taxes—which in itself suggests the diminished volume of substantial tax legislation.

One factor which has potentialities for disturbing the more or less regular course of events in taxation is the widespread tendency to utilize the tax machinery to accomplish specific ends—social or otherwise.

This is a prerogative formerly supposed to be reserved to the manufacturing interests through their control of protective tariff policy. Popularized by the Federal Government in its agricultural program, undistributed profits tax, and elsewhere, it has now been embraced by numerous groups in the field of State and local taxation.

But the defeat of so-called "Ham and Eggs" proposals in California and Ohio and of other radical proposals for enlarged pension and relief programs in popular elections in various States would seem to suggest that this movement has passed its crest.

Summary of U.S. State Sales Taxes

^a .5% on automobiles. ^b Plus tax varying according to number of stores. ^c New Orleans also imposes additional like tax; use tax is based on cost price. ^d Lower rates for wholesaling, automobiles, etc. ^e Lower rates for automobiles, etc. ^f Dealers in merchandise. ^g Except sales of food and drink in restaurants; alcoholic beverages taxed at 3%. ^h In excess of \$10,000; 2% for financial business. ⁱ Plus \$1 annual licence fee. ^j No tax if price is under 9¢; 1¢ if price is 40¢ or less; 2¢ if price is over 40¢ and not over 70¢; 3¢ if price is over 70¢ and not over \$1.00; 3¢ on each dollar over one plus same scale as mentioned upon fractional dollars. ^k Also gross tax on dealers at exchanges. ^m "Compensating" tax on taxable personal property. ⁿ Also surtax.

Great Britain.—In European countries tax policies have been dominated by the enormous necessities of the war and of enlarged defence programs on the part of nations not yet involved in actual warfare. Great Britain has adopted the most drastic income tax in history, with a basic rate which, after April 1, 1940, will be 37½% on taxable income, and with surtax rates under which the total tax on the largest incomes will approximate 80% of the entire income. The British Government has also increased the estate tax by 10%; has adopted an excess profits tax of 60%; and has levied a number of additional excise taxes on beer, liquors, tobacco and sugar.

Canada.—Canadian tax policy may now be embraced within the general scheme of British war finance. Tax measures adopted in 1939 include:

A war surtax, superimposed upon its existing income tax, equal to 20% of the total income tax previously payable.
An excess profits tax of from 10% to 60%.
Increases in the corporation income tax, in the excises on beer, wine, spirits, tobacco, and some other articles.
Extension of the sales tax to types of transactions not formerly included.

France.—The French Government has levied a general sales tax, a series of special excise taxes, an excess profits tax and an extraordinary "national contribution" in the form of a special income tax on wages, salaries, pensions and commercial, industrial, agricultural profits—in addition to the ordinary income taxes.

Germany.—German revenue measures have largely taken the form of confiscation of Jewish property, the seizure of Austrian and Czech gold, and the expropriation of property in Poland. Among more regular revenue measures, Germany has increased the compulsory social insurance and social welfare contributions, has levied a variety of special income taxes, for example on bachelors, spinsters and childless couples, and a special surtax on individual and corporate incomes, and has increased the taxes on alcoholic beverages and tobacco.

Italy.—The Italian Government has moved with characteristic conservatism, probably in consequence of ample financial and industrial preparation previously made. Thus far it appears to have resorted to only two new taxes—a 2% general income tax

CARTOONIST SANDESON of The New Orleans Tribune pokes fun at the Administration's vague tax plans for 1940

and a capital levy of $\frac{1}{2}\%$ on all property.

On the whole, European nations, with the exception of Germany, appear to be determined to finance the costs of the present war through current taxation rather than through borrowing or through currency depreciation, with a view to avoiding or minimizing the disastrous results of the inflationary types of financing that characterized the World War (1914-18). If they succeed in accomplishing this, it will be an achievement of immense significance. But the continent of Europe is now in the unhappy position of devoting its economic and human resources and the major portion of its entire productive capacity to processes of destruction. What onerous types of taxation or of virtual expropriation this may ultimately involve, it is yet too early to determine. (See also INCOME TAX; INITIATIVE AND REFERENDUM; LEGISLATION, FEDERAL: *Revenue Act of 1939*; SUPREME COURT OF THE UNITED STATES: *Taxation*.) (H. D. St.)

Tea. Great Britain requisitioned 50,000,000lb. of Ceylon tea and 130,000,000lb. of India tea and took control of the tea business in the United Kingdom at the outset of war in September. The Tea Brokers Association in London suspended the historic auction sales which in 1939 celebrated the centenary of their first sale. In the U.S., local prices rose five to ten cents a pound. In Canada a war revenue tariff of five to ten cents a pound was imposed September 12 on imports of tea. To relieve the temporary pressure on supplies, occasioned by British requisitions, the International Tea committee on October 6 raised the export quota of its three members, British India, Ceylon and Dutch East Indies (Sumatra and Java) from 90 to 95, thus providing an additional 40,000,000lb. to world supplies. The three countries exported a quota of 92½% in 1938, or 924,785,000 pounds. The increase in this quota, together with larger production in Nyasaland and Kenya, in effect gave a new record world supply of tea in 1939, *The Statist*, London, reported. The Tea Bureau, Inc., announced in September that there would be no recession in its "million dollar" advertising campaign in the United States in 1939 and 1940. The temporary interference with distribution, owing to the British Government's taking over supplies, led to a proposal that distribution could be simplified in the United Kingdom by establishing one standard blend of tea. Tea substitutes have appeared in Germany, because of the war blockade, and are said to consist of dandelion, lime blossoms and other dried herbs.

Formosa showed a heavy falling off in exports of black teas to the U.S. and Great Britain in 1939 because growers turned to the production of Pouchong tea in order to cultivate the Manchoukuo market. Government action, it was reported, will be taken by Formosa to prevent the restricting of black teas and the consequent loss of the U.S. and British markets.

Telegraphy. The year 1939 was characterized by systematic efforts to decrease the cost and at the same time to increase the speed and the accuracy with which telegraphic business may be handled.

Sub-centre Switching, a means by which a group of patrons or small offices, each having a private line to a local central point, may be automatically connected, over a limited number of trunks, with a main telegraph office for the direct transmission of business in either direction, was brought to a high state of perfection.

Channel Selection, a further development of the sub-centre switching idea, made possible the concentration of feeder circuits from a number of towns or cities in switching equipment at large telegraphic centres with automatic switching facilities so arranged that the feeder points may switch themselves through to a number of distant points.

Ocean Cable Picture Transmission.—Improved apparatus and processes made possible the facsimile transmission by cable between Europe and America of photographs, printed or written matter, line drawings, etc., in much more satisfactory detail than had ever before been possible by any means. Synchronous operation of revolving drums 3,000mi. apart, an essential of such service, was insured by the use of electrically driven tuning forks.

Maximum Usage of Facilities.—Means for obtaining maximum usage of expensive trunk lines by use of the varioplex, carrier systems, etc., were brought to a greater degree of perfection; and direct connections, with consequent elimination of relays, were thus made increasingly available.

The Automatic Telegraph.—The facsimile process was successfully applied to the production of automatic sending devices, enabling a patron to deposit his telegram in a slot machine by which the message is automatically transmitted to a central telegraph office or other point.

Another field of facsimile transmission was opened up by the introduction of recording machines which reproduce exact copies of transmitted matter, in the form of stencils or carbon master sheets, from which a great number of mimeograph or hectograph copies may be made.

Vermilion coloured recording paper, used quite successfully in connection with the facsimile telegraph during recent years, has been replaced by a much more satisfactory gray recording paper ("teledeltos") which combines improved appearance and legibility at less cost.

The Cable Depthometer was brought to such a state of perfection that when dragged along the ocean floor it magnetically determines and records on shipboard, the location of a submarine cable and the depth at which it is buried in the ocean bed.

Wireless Telegraph Equipment, in mobile units to be used in times of emergency when wires may be prostrated because of storms, earthquakes, etc. was made a part of the regular equipment of commercial telegraph companies.

Portable Carrier Equipment.—For the derivation of one or two additional telegraph communication channels for emergencies, or for short term use where the existing conductors are all in service, an inexpensive portable voice frequency carrier terminal was developed. The carrier currents are superimposed on a pair of wires without altering services already existing. From one to four frequencies are employed, depending on the number and direction of transmissions required. (R. B. W.)

Teleki, Paul (1879—), Hungarian statesman. For his biography, see *Encyclopædia Britannica*, vol. 21, p. 893. Count Teleki was called upon Feb. 16, 1939, to form a new cabinet after the serio-comic episodes leading to the resignation of Premier Bela Imredy, an ardent anti-Semite who discovered that his great-grandfather was Jewish. Teleki on February

24 ordered the dissolution of the Hungarian Nazi Party and the imprisonment of its leaders. On May 29 his Government received a substantial majority in the parliamentary elections, though the Nazis gained a number of seats. The position of Teleki's cabinet in the early days of the European war was a rather delicate one. Though traditionally friendly with the Poles, Hungary was obviously unwilling to antagonize Hitler. On August 26 Teleki's cabinet refused Rumania's proffered non-aggression pact and proposed instead a treaty that would guarantee minority rights in both countries. On September 14 Hungary declared its neutrality. The next week diplomatic relations with Russia, severed since February 2, were resumed.

Telepathy: see PSYCHICAL RESEARCH.

Telephone. Many technical advances in the past decade have led to the attainment of notably higher standards of telephone service. Outstanding among them are important improvements in the design of the telephone transmitter and receiver and the other apparatus placed in subscribers' premises, and improvements and extensions in line and radio facilities for long distance communication. The use of dial telephone equipment in central offices has continued to expand beyond the point at which it stood in 1938.

The first overseas radio telephone channel was that between the United States and England, opened for service in 1927. Progress in this field has been so rapid and the demand for international telephony has been so insistent that since 1927 more than 175 overseas radio telephone circuits for the handling of public message business have been created and cover the earth as an invisible yet very substantial network.

The original radio telephone channel between the United States and England (it is still in use) employs frequencies lying in the long wave-length range. It has from the outset used the single-sideband type of transmission. More recently, the technical problems presented by the application of the single-sideband principle to short wave-length channels have been overcome, thus effecting important economies in the use of a very important, but limited, range of wave-lengths. Twin operation now occurs on two transatlantic channels.

Today 98% of the world's telephones are interconnected. Behind this rapid advance in international telephony stand, of course, important developments in the instrumentalities of radio communication. Notable among these may be mentioned water-cooled vacuum tubes of large power, greatly improved antennas, and improved auxiliary devices for the more effective overcoming of the interference which is inevitably associated with radio transmission.

Additions of very fundamental importance are continuing to be made to the long distance land lines, both in the United States and in Europe. Wherever possible these additions take the form of lead-covered cable, each cable containing several hundred distinct circuits. The advantages of cable circuits as compared with open-wire lines arise particularly from their increased electrical stability and freedom from failure because of storms, and hence increased reliability in service. The year 1939 has also seen the introduction of notable improvements in exchange telephone cables. As many as 3,000 wires of No. 24 gauge and 4,200 wires of No. 26 gauge are being placed within a lead sheath of 2½ in. over-all diameter. Previously, 3,600 No. 26 gauge wires represented the maximum. This increase has been achieved by improvements in insulation whereby wires can be arranged more compactly.

Carrier Methods.—In spite of the fact that the usual toll cable carries as many as 200 to 400 individual lines, the problem of multiplexing these lines by the "carrier" principle has assumed economic importance. The development of a very successful

twelve-channel system has been effected and so far as the United States is concerned, numerous installations are under way.

Coaxial Cable.—The coaxial cable, an additional instrumentality for providing more abundant long distance circuits, has successfully passed its trial stage. In the hands of American telephone engineers it has already been demonstrated as capable of providing as many as 500 telephone channels over a distance of 2,000 miles. The first section for regular telephone and telegraph service is undergoing installation between Minneapolis, Minn. and Stevens Point, Wis. a distance of about 200 miles. In brief, the coaxial cable operates on the multiplex or carrier principle, enabling two pairs of conductors (each pair consisting of a wire surrounded by a concentric metal pipe and used to transmit in one direction only) to provide a large group of telephone channels or, alternatively, a single television channel, depending upon the range of the filters and the amplifying devices or repeaters with which the cable is equipped. In Europe—notably England, France, and Germany—the coaxial cable has been more stressed as a conductor for the point-to-point transmission of television programs than as an adjunct to the telephone. Both uses are, however, closely allied.

By far the major portion of the development work upon the coaxial cable has necessarily centred on the amplifying and filtering (or hand-splitting) devices which are needed. The transmission loss of the cable is such that the message currents must be re-amplified every five to ten miles, while the filters used to separate the hundreds of messages from one another without extravagant waste of the frequency hands separating the channels represent virtually the ultimate limit of refinement.

Crossbar Office.—The transformation of central office equipment from the manually-operated to the dial-operated type has

proceeded steadily both in the United States and in Europe. The important new dial system designated by the term "crossbar," which was introduced into daily operation in 1939 in New York city, has continued to expand.

Lynn, Mass., has become the first city to be served entirely by crossbar offices.

Toll Dial System.—The important field of application of the dial system is for handling local traffic. Both in Europe and in the United States, however, it is being employed to an increasing degree for the completion of toll calls. Toll dialing has been in use in Switzerland and Belgium, as well as in certain districts of the United States, and during the year 1938 two areas in the State of Ohio were converted from manual to dial toll. One of these embraced Dayton, Springfield and Columbus, and the other Cleveland, Akron, Canton, Alliance and Youngstown.

Miscellaneous Developments.—The use of harbour radio to furnish telephone service to coastal and harbour vessels has assumed notable importance. By the end of 1939 there were 15 land stations in the United States equipped for this service and more than 1,600 boats had connecting equipment. The land stations are associated with the wire telephone network so that the boats have at their disposal the full range of local and long distance connections.

Telephone emergencies are sufficiently frequent to have warranted the development of special radio facilities that can be used for the temporary bridging of gaps in the wire plant. Radio was thus used to notable advantage in the case of the New England hurricane in 1938. A radio unit now standard in the Bell System includes a gasoline engine for power supply, a demountable antenna, and means for connecting to any standard telephone circuit. The outfit weighs less than 500lb. and is in a form convenient for rapid transportation and installation.

The year 1939 inaugurated a service in New York city whereby telephone customers may obtain the latest weather information and forecasts by calling or dialing WEather 6-1212. The reports are recorded upon endless magnetic tape and the equipment is so designed as to transmit at the proper sound level to as many customers as may be simultaneously connected to the Bureau. Chicago also began the service in 1939 and similar projects are under way for other large cities.

McDONALD OBSERVATORY, on Mount Locke, Tex., was dedicated May 5, 1939, with 400 distinguished guests attending

Telescopes. The following list of large telescopes represents the most important instruments completed or now under construction:

200-Inch Reflecting Telescope (F 3.3) of the California Institute of Technology. To be operated in co-operation with the Mount Wilson Observatory of the Carnegie Institution of Washington. Located on Palomar mountain in Southern California. Dome, 135ft. in diameter, and major portions of mounting, weighing 500 tons, completed and erected. Optical figuring of 200-in. mirror on its supporting system still in progress. Auxiliary mirrors partially figured and spectrographs and plateholders largely designed.

82-Inch Reflecting Telescope (F 4) of the McDonald Observatory. Operated jointly by the University of Texas and the University of Chicago. Located on Mount Locke in Western Texas. Completed and in regular operation.

76-Inch (193 cm.) Reflecting Telescope of the Observatoire de Haute-Provence, France. Established by the Service d'Astrophysique de la Caisse Nationale de la Recherche Scientifique. Located near Saint-Michel (Basses-Alpes). The large mirror has been cast and is now being figured. Two other reflecting telescopes with apertures of 31in. (80 cm.) and 47in. (120 cm.) have been completed.

74-Inch Reflecting Telescope (F 4.9) of the Radcliffe Observatory, Oxford. Located at Pretoria, South Africa. Mirror figured and nearly ready for aluminizing and dome and buildings erected.

21-Inch Twin Photographic Refracting Telescope (F 7) of the Lick Observatory of the University of California. To be located on Mount Hamilton, California. Mounting completed but not erected and the figuring of one lens well advanced.

Several large telescopes of the Schmidt type with wide fields and of great photographic efficiency are under construction. Among these are:

48-Inch Schmidt Telescope (F 2.5) of the California Institute of Technology. Planned as an adjunct to the 200-in. telescope. The disc for the 72-in. spherical mirror is now being figured and the glass for the 48-in. correcting plate has been secured. The dome has been erected and the mounting is under construction. A large objective prism will be used with this instrument.

39-Inch Schmidt Telescope (F 2) of the Hamburg Observatory, Bergedorf, Germany. Provided with a 39-in. spherical mirror.

These last two instruments are under construction at the Zeiss works in Jena.

The principle of the Schmidt telescope has been applied most successfully to spectrographic cameras at the coudé focus of large reflecting telescopes. Notable cases are with the McDonald reflector and the 100-in. telescope at Mount Wilson where a 36-in. concave mirror is in regular use with the 100-in. telescope. Correcting lenses designed by Ross to increase the field of good definition of reflecting telescopes are also coming into more general use. After considerable experimentation several lenses of this type are being designed for the 100-in. and 200-in. telescopes in California and the 82-in. reflector in Texas. (See also ASTRONOMY.)

(W. S. Ad.)

Television. Throughout 1939 developments in television continued to hold international interest. As before, the most important application appeared to be in the field of

Above, left: THE FIRST TELEVISION SETS were placed on sale in Apr. 1939

Above, right: THE FIRST U.S. SPORTS EVENT ever televised was a Princeton-Columbia baseball game in New York city, May 17, 1939

home broadcasting, and in this service further explorations and improvements were made in many countries, including the United States, Great Britain, France, Germany, Spain, Italy, Argentina and the Netherlands. Television as an adjunct to toll telephone lines, for personal intercommunication by sight as well as by sound, was extended in Germany, where it is reported that such dual connections have been provided between public pay stations in Leipzig, Nuremberg and Munich as well as to or between four operating points in Berlin. In the German stations, large reproducing screens are reported in use as giving images approximately 18"x24" in size, while similar two-way installations in Spain and Buenos Aires have utilized smaller cathode-ray reproducers. Military applications of television are the subject of intensive study, as are also direct commercial uses from which it is hoped to derive an income for the support and development of the art.

In Great Britain, television broadcasting (begun in late 1936) was continued until blacked-out by the European war. A number of new models of television receivers were put on the market, almost all of them using cathode-ray tubes. Varying picture sizes, from the small images provided by tubes of 5" screen diameter up to the larger views made possible by 15" tubes, became available at a wide range of prices. The major improvements shown by the new model receivers were directed toward simplification of tuning and adjustment.

Television broadcasting in New York was re-inaugurated in April 1939, the new 441-line high definition standard having been adopted, and about a dozen hours per week of visual-and-sound programs have been sent out since then. The wavelength used is approximately 6.3 metres (44-50 megacycles per second) and the service radius is said to be 30mi. or more. Several manufacturers have offered television receivers to the public, these sets using cathode-ray tubes of from 5" to 20" diameter and the price range extending from about \$150 to approximately \$600. The lower-priced receivers usually provide picture reproduction only, and require association with an ordinary broadcast receiver for the rendition of the accompanying sound.

Other cities in the United States also have experimental television stations, but in no case is the program service rendered as extensive as in the older art of aural broadcasting. The Federal Communications Commission has released a report on television, in which recommendations are made for the allocation of the seven principal channels to potential television transmitters in a large number of cities in the U.S.A.

The commission has also proposed new "rules" for the regulation of television in the U.S.A., and suggests two general categories of television transmitters, one aimed at technological development and unrestricted as to transmission standards, the other directed largely toward program development and tests of public acceptance and therefore required to use the 441-line standard recommended by the Radio Manufacturers Association and adopted by a number of organizations which have put television receivers on public sale. Public hearings for discussion of these regulations have been called, to be held in Washington early in 1940. There appears to be some question as to whether any fixed standard, such as 441 lines, should now be adopted in view of the possibility that better and larger pictures may later be made available on some other basis.

French and German extensions of television broadcasting, like those of Great Britain, are understood to have been restricted by the European war although prior to Sept. 1939, they were progressing in normal fashion. In Germany the largest organizations interested in television broadcasting had co-operated in the design of a series of standard television receivers for introduction to public use, but no information is available as to their present

status. Among presently neutral European nations, Italy had installed a complete television studio and transmitting equipment in Rome, and Holland had carried forward investigation and construction of high-definition apparatus.

There is obviously a striking similarity in the technical work being carried on in various parts of the world. Although the economic problems of television in one country appear to differ from those in another, the physical and electrical problems are very nearly identical everywhere. Lay observers ask for larger reproduced pictures, more brilliance (so that the room need not be darkened) and still more pictorial content than has so far been proved practical.

Scientists say that the present size, brilliance and definition of television reproductions is on a level of perfection thought impossible only a few years ago, and that today's results should be accepted as a technological accomplishment of the maximum magnitude. So a question arises as to the economic situation of television: If those who supply insist that the system is acceptable and of service value, but those who are expected to buy retort that they will have none (or very little) of it, what is the answer?

To consider the two nations in which perhaps the greatest progress has been made, in Great Britain the expense of installing television transmitters and of providing programs is paid by the general tax on all broadcast receivers, whereas in the United States the cost of all development of apparatus and programs must be met by individuals or organizations that are willing to speculate huge sums in the expectation that eventually the system will rest upon a sound economic base. Wide apart as these two positions may seem at present, it is probable that they will finally approach each other, for neither taxation nor private capital could be provided indefinitely for the sustenance of a venture that failed to provide a useful public service. The fact that funds have been made available for world-wide television research and development, and in large amounts, is probably a sound indication that it is entirely justifiable to believe in the future of television. The system should offer vast opportunities for both service and profit, once the economic problems are solved. (See also BROADCASTING.)

(J. V. L. H.)

Tellurium. The production of tellurium, like that of selenium, is largely confined to the United States and Canada, as a by-product of the copper refineries. United States production was 51,400lb. in 1937, but only 11,100lb. in 1938; Canadian production has been steadily increasing since 1934, and in 1939 reached 48,200 pounds. Production could be considerably increased if uses demanded it, but increases in consumption have been slow, since most of them required only small amounts; for example, one of the important new uses is as a hardener for chemical lead, but the percentage of tellurium required is so small that the maximum demand for this use does not exceed 50-75 tons annually.

(G. A. Ro.)

Tempelhof Airport: see AIRPORTS.

Temperley, Harold William Vazeille (1879 - 1939), British historian, was born on April 20 and was educated at King's college and Peterhouse, Cambridge. From 1904 to 1938 he taught at Peterhouse; he also lectured at Harvard (1911-12) and Stanford (1936) in the United States. Temperley first came into prominence when he published his *Life of George Canning* (1905). This work was followed by *Frederick the Great* (1915), *History of Serbia* (1917) and other works, the most notable of which was *The Foreign Policy of Canning* (1925). Temperley was the official British historian of the Paris peace conference and was co-editor

of British documents on the origins of the World War. From 1933 to 1939 he was president of the International Historical congress. He died at Cambridge on July 11.

Templeton, Fay (1865-1939), a favourite U.S. operetta singer of the late 19th and early 20th centuries, was born on Christmas day at Little Rock, Ark., the daughter of an opera director and a singer. She made her theatrical debut at the age of three in the role of Cupid, and at 15 she was playing important parts in light operettas. She later joined the famous vaudeville team of Weber and Fields and with them made a national success of the song "Rosy, You Are My Posy." Her best-remembered appearance was in George M. Cohan's *45 Minutes from Broadway* from 1905 to 1907. In the latter year she announced her retirement, but she returned to the stage in later years in Gilbert and Sullivan roles, and her last appearance was in *Roberta* in 1933. She died October 3 at San Francisco.

Tennessee, the sixteenth State to enter the Union, popularly known as the "Volunteer State"; State flower, iris; State bird, mocking-bird; area, 42,022 sq.mi.; population according to the U.S. Census of 1930, 2,616,556; estimated July 1, 1937, 2,893,000. Capital, Nashville, 153,866. The only city with larger population is Memphis with 253,143. Of the State's population, 896,538 or 34.3% are urban; 2,138,619, white; 477,646, coloured; 2,125,553 native-born white; 13,066 foreign-born white.

History.—Governor, Prentice Cooper; secretary of State, A. B. Broadbent; attorney-general, Roy Beeler; commissioners as follows: agriculture, C. C. Flannery; conservation, J. Charles Poe; education, B. O. Duggan; finance and taxation, George McCandless; highways and public works, C. W. Phillips; institutions, A. T. Taylor; welfare, Paul Savage; insurance and banking, J. M. McCormick; labour, S. E. Bryant; public health, W. C. Williams; railways and public utilities, W. D. Hudson, Porter Dunlap and Leon Joroulman. Commissioner of administration has been discontinued in 1939, and institutions and public welfare were separated. The last legislature passed a marriage law requiring premarital examinations after 1940. It also repealed the 30-year old prohibition law, thus leaving package sale of liquor to local determination.

Education.—Percent of illiteracy in 1930 for whites was 5.4, for coloured 14.9. Of 5,764 elementary schools 1,467 had 3 or more teachers in 1938, one-teacher elementary schools declined from 3,555 in 1927 to 2,684 in 1938. Enrolment in elementary schools was 522,138. In 1938, all but 17.3% of elementary teachers had more than high school training; 27.0% were college graduates. The State maintains seven institutions for higher learning with an enrolment at the regular session of 9,791 students in 1937-38. The estimated valuation of these was \$15,050,001 in 1935. In addition there were separate schools for the blind, the deaf and underprivileged children; three State hospitals for the insane; a home and training school for feeble-minded; and four training or correctional schools, respectively for white boys, Negro boys, white girls and Negro girls; a commission and workshop for the blind; and two State penitentiaries.

Finance.—In 1939 there were 72 national banks with 17 branches, and 228 State with 33 branches, with assets of \$456,633,677 national, and \$154,757,323 State. Building and loan associations numbered 52 with assets of \$28,061,067. Insurance payments made by policyholders amounted to \$61,179,514 in 1938. In 1938 there were 547 companies licensed to write insurance in the State.

Agriculture.—There were 273,783 farms in 1935; 1,308,420 farm population; 19,085,837 acres in farms with 6,134,200 acres

of crop land harvested. Estimated value of crop production was \$85,537,000 in 1938. Corn 2,689,000ac., 68,570,000bu.; cotton, 791,000ac., 487,000 bales; hay, 1,660,000ac., 1,850,000 short tons; tobacco, 126,000ac., 111,855,000 pounds. Cattle on farms Jan. 1, 1939, were 1,170,000; hogs, 1,154,000; horses and mules, 453,000. Cash farm income from crops was \$70,380,000 in 1938; from livestock and livestock products \$55,578,000; Government payments to farmers were \$12,320,000; while the gross value of agricultural production for the State was \$174,198,000. Cash farm income was \$125,958,000 in 1938. Tuberculin testing of all cattle in the State was completed in 1935. Commercial forest area in 1929 was 14,000,000 acres. The cut in 1935 was 337,008,000 bd.ft., total value of lumber products \$11,944,159 of which \$6,831,597 were added by manufacture.

Manufactures.—In 1937 there were 1,991 manufacturing plants yielding products valued at \$707,986,784, of which \$295,626,708 constituted value added by manufacture. Value of mineral production was \$34,893,847 in 1937. Bituminous coal production in 1937 was 5,212,471 short tons; phosphate rock 899,298 long tons. Value of phosphate rock produced was \$3,725,601 in 1938. Manufacturing and urbanization are making marked progress in the State.

The Great Smoky Mountain National Park with 174,230 acres in Tennessee attracted 761,567 visitors for the year ending Sept. 30, 1939.

(C. E. A.)

Tennessee Valley Authority. Kentucky dam, near Gilbertsville, Ky., 22.5mi. above the mouth of the Tennessee river was under construction in 1939. Largest of the Authority's projects, this dam will be 160ft. high and 8,650ft. long. Its reservoir of 256,000ac. will hold 6,100,000 ac.-ft. of water; its navigation lock, 110 by 600ft., will have a maximum lift of 73 feet. The Kentucky dam reservoir will create 184mi. of navigable channel extending to Pickwick Landing dam and be able to store enough flood waters to cut two feet of Mississippi river flood crests. This is equivalent to preventing flood damages in excess of \$100,000,000. Present plans do not include an initial power installation at Kentucky dam. Estimated cost is \$95,000,000.

Watts Bar dam is being built at the head of the projected Chickamauga reservoir. This latest project of the Authority will be 2,970ft. long and 97ft. high. Its 72-mi. long reservoir will extend the navigable channel upstream to Lenoir City. The lock at the dam will have a 60 by 360-ft. chamber and a maximum lift of 70 feet. The reservoir, 41,500ac. in area, will hold 1,132,000 ac.-ft. of water. Initial power installation will be three 42,000-b.p. generating units. One more dam has been recommended for construction by the Authority, the Coulter Shoals project near Lenoir City. A dam at this point would complete the improvement of the Tennessee river to Knoxville.

In its peacetime utilization of the Federal munitions plants at Muscle Shoals, the Authority is manufacturing highly concentrated phosphatic fertilizers. These products, containing from 43% to 65% available plant food, are being tested by agricultural agencies in more than 40 States and by nearly 26,000 practical farmers in 20 States. By Aug. 1, 1939, some 240,000 tons of these plant foods had been distributed to these agencies and farmers for test purposes and to the Department of Agriculture for distribution at cost in lieu of benefit payments.

Since 1933, about 500,000ac. of farm lands in the valley have been terraced. Severe erosion on farms totalling approximately 1,000,000ac. has been checked. Accurate soil surveys of more than one-third of the region's 41,000 sq.mi. have been made. About 100,000,000 trees have been planted, the majority of them on privately owned land to help restore submarginal areas.

SARAH PALFREY FABYAN (left) and Alice Marble of the U.S.A. formed the best women's doubles team of 1939, winning both the Wimbledon championship and the Wightman Cup

In addition, research is conducted with a view to demonstrating new farm equipment and the local processing of the region's farm crops through the application of electrical methods.

The Authority is directed by statute to give preference in the sale of its surplus electric energy to States, counties, municipalities, and co-operative associations. Following a policy of non-duplication of existing facilities, it co-operated with municipalities and co-operatives in the purchase of existing utility distribution systems in the region. The largest of a series of such purchases is the acquisition of the electric properties of the Tennessee Electric Power Co. by the Authority and 34 municipalities and associations.

By Sept. 15, 1939, TVA power was being used by approximately 320,000 ultimate consumers, about 270,000 of whom were residential and farm customers. The power was being distributed by 61 municipalities, including the cities of Knoxville, Nashville, Memphis, and Chattanooga, Tenn., 28 rural co-operative associations, and in several districts operated temporarily by the Authority. In addition, TVA sells power to power companies and industrial plants, and uses its electricity for dam construction, and in its fertilizer plant at Muscle Shoals.

The TVA residential rate schedule is as follows:

- 3¢ per kw.-hr. for first 50 kw.-hr. per mo.
- 2¢ per kw.-hr. for next 150 kw.-hr. per mo.
- 1¢ per kw.-hr. for next 200 kw.-hr. per mo.
- 4 mills per kw.-hr. for the next 1,000 kw.-hr. per mo.
- 7½ mills per kw.-hr. for all over 1,400 kw.-hr. per mo.

The Authority is headed by a three-man board of directors whose policies are executed by a general manager. Following disagreement among members of the board and consequent removal of the then chairman, Dr. Arthur E. Morgan, by the President, Congress ordered an investigation of the Authority by a joint Congressional committee. The findings of the majority of the committee, reported April 1, 1939, cleared the Authority of the charges against it and concluded that "The Authority should be regarded as a settled and established institution in the Valley. Its construction program should be carried to completion so that money already invested may not be wasted or inadequately supported by revenue. The agricultural, forestry, public health, and other regional development programs of the Authority are generally acknowledged to be beneficial to the region and to the nation as a whole, and should be continued. The Authority has already dem-

onstrated the value of unified river control under public management. It is on the way to full demonstration of the practicability of promotional rates for domestic electric service, which may be adopted as well by private utilities as under public ownership."

Both the constitutionality of the Authority and its right to dispose of surplus power have been attacked in numerous suits since the Authority's inception.

The Authority was upheld in two major litigations that were carried to the Supreme Court, in the first, the "Ashwander Case," by an 8-to-1 decision on Feb. 17, 1936, and in the second, the so-called "18 Utilities suit," by a 6-to-2 decision on Jan. 30, 1939. (See also ELECTRICAL INDUSTRIES; PUBLIC UTILITIES; UNITED STATES.) (H. A. MN.)

Tennis. The tennis season of 1939, fortunately completed despite the outbreak of another war in Europe, was a year of indifferent play and championships won in most instances by mediocre players. There was no outstanding star, no one like the Vines of 1932, the Crawford of 1933, the Perry of 1934 and 1936, or the Budge of 1937 and 1938, but a number of rather colourless performers in different lands.

The first major championship of the year was held at Melbourne, Victoria, in January. John E. Bromwich, the home star, won two of the three Australian titles, the singles, and the doubles with Adrian Quist. He took the singles without the loss of a set, defeating Quist in the finals. In June the French championships saw the straight set defeat of Robert E. Riggs of the United States by his compatriot, Donald McNeill. Riggs in 1938 was ranked second and McNeill thirteenth in the United States.

In the Queen's club championships the end of June, Riggs got only one game from Gottfried von Cramm, the former German champion, in the semifinals. However he atoned somewhat for these defeats by capturing the singles at Wimbledon in July, defeating his compatriot Elwood T. Cooke in a long and dullish five-set match in the finals, remarkable for the fact that many of the gallery left in the middle. The field was much better in the women's events which were won by Miss Alice Marble, the champion of the United States. She took her last two contests with the loss of but two games, those to Miss Kay Stammers of England in the finals. What may perhaps be the last Wimbledon for some years was on the whole replete with undistinguished play.

Yugoslavia won the finals of the European zone of the Davis Cup in July, defeating the Germans by three matches to two at Zagreb. In the Interzone finals at Boston in August, Franjo Punccec, the leading Yugoslav, beat a most indifferent Bromwich, but the Australians had no trouble winning the other matches and qualified to meet the United States in the challenge round, four to one.

Two Australian pairs gave the home players a lesson in doubles, and the title of the United States was won by Quist and Bromwich who defeated their teammates Crawford and Hopman in straight sets. The challenge round of the Davis Cup, held at the Merion Cricket club in Philadelphia was, like its predecessor of 1914, upset by war and war's alarms. The sensation of the meeting was the recovery of the challengers from an apparently hopeless position on the evening of the first day. Bromwich and Quist lost their matches to Riggs and Parker, respectively, on the afternoon of Saturday, September 2, as England was preparing to declare war against Germany. Once the die was cast they found their form, won the doubles the next day, and on September 4 Quist defeated Riggs in straight sets and Bromwich swamped Parker. This gave them victory by three matches to two, and the Davis Cup went into Australia's possession as it did on the eve of war 25 years ago.

The championship of the United States on September 7 at Forest Hills was won by Riggs, but the surprise was the play of Welby

Van Horn, a 19-year-old high school boy from California who defeated Wayne Sabin in the quarter-finals and Bromwich in the semi-finals in five sets, being two sets to love down in both matches. Riggs in the finals cleverly used a bad wind and by playing good, sound tennis was on top of Van Horn all through the three sets.

Miss Alice Marble repeated her Wimbledon triumph, but Miss Helen Jacobs in the finals played even with her until the tenth game of the third set in a dramatic and vivid match in which the champion of 1938 was extremely lucky not to be beaten by the courage and court tactics of the champion of 1935. There were few contests anywhere in amateur tennis in the summer of 1939 which held one's interest and attention as did this women's finals at Forest Hills in the middle of September. (J. R. Tu.)

Texas, south-central State of the United States, first a colonial possession of Spain and later a part of Mexico, became an independent republic in 1836 and was admitted to the United States in Dec. 1845. It is sometimes called the "Lone Star State," because of the State flag with a single star. Area, 265,896 sq.mi. (largest in the Union); population (U.S. census, 1930), 5,824,715; (estimated, 1939) 6,300,000. Capital, Austin, population (estimated, 1939), 90,000. The three largest cities, with population estimated, 1939, are Houston, 400,000; Dallas, 370,000; San Antonio, 315,000. Of the State's population in 1930, 2,389,348, or 41%, were urban; 4,283,491 were whites (89,396 foreign born); 854,964 coloured; 686,260 other races (683,681 Mexicans). The coloured population is heaviest in eastern Texas, the Mexican in south-western Texas.

History.—The dominant figure in State politics throughout 1939 was the governor, W. Lee O'Daniel, elected the year before on a platform calling for pensions of \$30 per month (half to be paid by the U.S. Government) for all persons over 65 years of age. Controversy over the governor's social security program made the session of the 46th legislature, which opened in Jan. 1939, the longest in the State's history and one of the most turbulent. A bill known as Senate Joint Resolution 12, sponsored by the governor, would have submitted to popular vote a constitutional amendment embodying a sales tax and a tax on natural resources, but with a permanent "ceiling" on the latter that could not be raised. The measure was opposed by 56 members of the lower house, sufficient to prevent passage.

Another bill, passed by the legislature and signed by the governor, added 50,000 old-age pensioners to the 118,000 already on the rolls, but no money was appropriated, and the sums received by the pensioners decreased within the year from an average of \$14 to about \$8 per month. For the first time in many years there was no special session of the legislature, as the governor refused to call one.

Other leading officials of the State were Coke R. Stevenson, lieutenant-governor; Gerald Mann, attorney-general; Charlie Lockhart, treasurer; Bascom Giles, commissioner of general land office; J. A. McDonald, commissioner of agriculture; L. A. Woods, superintendent of public instruction; George H. Sheppard, comptroller; the railroad commission is composed of Ernest O. Thompson, Lon A. Smith and G. A. Sadler.

Education.—The State maintains a general system of public schools, extending from the primary grades to colleges and a university.

In 1939 the scholastic population, from six to seventeen years inclusive, was 1,566,544, of whom 244,841 were coloured. The schools below college rank are supported by both local taxes and State funds.

The latter, apportioned at \$22 per pupil, totalled \$34,463,968. Fully accredited four-year high schools number 1,193. The State

also supports 16 institutions of higher learning, including one for Negroes. There are more than 20 denominational and privately endowed colleges.

Charities and Correction.—The State maintains 22 eleemosynary institutions. Half of these are hospitals for mental and nervous cases; a new one was completed at Big Springs in 1939, but accommodations for such cases were still inadequate. There are also two sanatoriums for tuberculosis victims; schools for the blind and for the deaf (white and coloured); two homes for delinquent children; two for white orphans and one for coloured; one for defectives; one for crippled children. There is a home for Confederate veterans and one for the widows of veterans. A number of homes for orphans and for crippled children are supported by private means, religious sects and fraternal orders. The State prison system is extensive; the principal unit is the penitentiary at Huntsville.

Banking and Finance.—The 446 national banks in Texas, according to the report of Oct. 2, 1939, showed a total capital stock of \$75,799,000, plus surplus, profits and reserves of \$76,269,000; deposits, \$1,362,562,000; loans, \$421,879,000; cash reserves, \$672,379,000; total resources, \$1,518,958,000. The 397 State banks on the same date showed a total capital stock of \$16,795,500; deposits, \$193,624,453; loans and discounts, \$79,419,046; total resources, \$235,231,132. The State treasury, for the year ending Aug. 31, 1939, showed receipts from all sources of \$230,594,349. The total disbursements amounted to \$231,884,773. At the end of 1939 a cash balance of nearly \$16,000,000 was announced, despite deficits in three funds amounting to \$25,800,000. The general revenue fund had a deficit of \$21,700,000 and the Confederate pensions and old-age pensions accounts also showed deficits.

Agriculture, Minerals and Manufactures.—Because the drought that set in the year before continued throughout 1939 over most of the State, and because acreage of many crops was reduced, there was a decline in the yield of all important agricultural products. But a general increase in the price level more than offset the loss in quantity, and the total value of Texas crops in 1939 was \$314,765,000, as compared with \$299,394,000 in 1938. The following products declined in both quantity and value: the cotton crop of 2,830,000 bales brought \$121,690,000; cotton seed (1,258,000 tons) brought \$26,670,000; wheat (27,650,000bu.) brought \$17,420,000. The corn crop of 73,376,000bu., though smaller than in 1938, brought \$41,091,000, an increase of nearly \$8,000,000; likewise a reduced yield of grain sorghum (38,115,000bu.) brought \$22,488,000, an increase over 1938 of \$5,000,000. The livestock industries suffered from the drought, but heavy losses were offset to some extent by better prices for bees and lambs. The wool clip for 1939 was estimated at about 76,000,000lb. (or about 20% of the total for the U.S.) and the clip of mohair at 14,000,000lb. (84% of the U.S. total, a virtual monopoly). Prices were generally low.

The petroleum reserves of Texas were estimated (Jan. 1, 1939) at 9,447,764,000bbl., or over 54% of U.S. reserves and over 27% of world reserves. According to latest figures Texas produced about 40% of the U.S. petroleum yield during the year, or over 475,595,000 barrels. In Oct. 1939, there were 88,934 oil wells in the State, and over 200,000 people were employed by the industry. The daily output was over 2,000,000bbl., although the potential output was estimated at 35,000,000 barrels. Production was curtailed by the Texas Railroad Commission by means of proration and the shut-down. At the beginning of 1938 wells were shut down for only 2 days in the week; by Jan. 1940, all wells were shut down for 13 days in the month. The year's production of oil was valued at close to \$500,000,000. The value of the sulphur produced during the year (2,058,940 long tons, or 86% of U.S. production) was

\$37,000,000. The value of natural gas produced in the same period was \$23,000,000.

There was considerable growth in manufacturing during 1939. Employment and payrolls increased. New plants were put into operation, including a large one for making newsprint. Petroleum refining was still the most important of the State's manufactures, with 125 refineries. There was an increase in the number of foundries and plants for the manufacture of carbon black and clothing, and a notable expansion in food producing and processing, especially meat packing and baking. Two of the three large dams for flood prevention and generation of power on the Colorado river were completed during the year. Business conditions varied in different parts of the State, but on the whole showed improvement. (C. W. RA.)

Texas, University of. Dr. Homer Price Rainey was formally installed as president Dec. 9, 1939. On May 5, 1939, McDonald Observatory, the university's astronomical research plant built on Mount Locke in West Texas, by the \$1,000,000 bequest of the late W. J. McDonald, Paris, Texas, capitalist, was dedicated. A bequest of \$2,000,000 from the estate of the late Will C. Hogg of Houston was announced July 15, earmarked for establishment of a distinguished lecture foundation and a State-wide mental hygiene clinic. Teaching personnel for the main university was increased from 460 to 500 for 1939-40. Dr. Americo Castro, formerly professor at the universities of Brazil, Madrid and Wisconsin, and former Spanish ambassador to Germany, was named distinguished professor in Romance languages, Sept. 15, 1939, and E. L. DeGolyer, Dallas oil magnate, was named distinguished professor in geology, effective Feb. 1, 1940. A \$25,000 research institute in pure science and academic fields was established Sept. 1, 1939. A radio research bureau was established Sept. 1, 1939, and on November 19, a \$20,000 radio studio was dedicated. An institute of Latin-American studies was approved by the board of regents to be launched with the 1940 summer school. Enrolment at the main university for the fall semester of 1939 totalled 10,206. Three hundred and seventy-six additional students are enrolled at the Medical school in Galveston, and another 173 are enrolled in the college of nursing there. (H. P. R.)

Textile Industry. War in Europe, which brought the industries of the combatant nations under practically complete state control, brought to the textile industry of the United States in the fall of 1939 a boom which revived nostalgic memories of the "good old days" in textiles. Active, almost feverish, demand set in in most branches of the markets; prices of goods advanced sharply; mill production schedules were extended in an effort to meet the pressure for deliveries. It is true that improvement had set in before the outbreak of the war, and that textile mill activity in the United States during the first three-quarters of 1939 was well ahead of that for the corresponding period of 1938. However, the tempo of demand which developed after war was declared was far different from that which had preceded it. Furthermore, it carried with it an opportunity for a profit, which had been missing from most of the textile business of the first eight months of 1939. Manufacturing margins broadened, and the curse of the textile industry—profitless operation—was removed, temporarily at least. Fortunately, manufacturers confined their sales to a relatively few months ahead, and did not engage in long-time commitments which preceded the debacle of 1937. When the year 1939 closed, the industry was still active with prices relatively firm, but with the outlook for 1940 clouded by the same uncertainties which the world situation imparted to all industry.

Next only to the war as a factor in the economics of the textile industry in the United States during 1939 was the wage-hour law. Effective Oct. 24, 1938, this act had its first full year of operation in 1939. However, its effect was limited by the fact that for many branches of the textile industry specific wage minima were not set and consequently those relatively low mandatory levels in the law itself prevailed. Industry committees for practically all divisions of the industry were organized and got into action, but only the group comprising cotton, rayon and silk, and that covering seamless and full-fashioned hosiery, reached the stage where the administrator actually put into effect recommendations made by the respective industry committees. Of these only the cotton wage created anything like a major disturbance—and that was soon lost in the shuffle of the war boom. For details of this situation *see* COTTON.

Fibres.—From a technological standpoint, there were developments as thrilling, in their own way, as were the war-boom and the wage-hour administration in the economic zone. Outstanding among the technical trends was the production of new synthetic fibres which threatened fundamental changes in textile manufacture. Of these new materials the most highly publicized was Nylon. The popular interest it aroused was due primarily to the fact that it offers a threat to silk in the manufacture of full-fashioned hosiery, which has been silk's almost exclusive domain. Another new synthetic fibre, Vinyon, offers particular competition to cotton in the field of industrial fabrics such as filter cloths, tire fabrics, etc. However, there is a basic change going on which means possibly more than do these specific new materials. Ever increasing use of synthetic fibres cut in short lengths, and known as rayon staple fibre, offers new outlets in practically all branches of the textile industry. For example this cut fibre is now used extensively as a decoration and an adulterant in woollen and worsted goods.

Textile Processes and Machinery.—Machine and process developments have been less spectacular than those in the field of raw materials, but their net result has been the same relentless pressure upon manufacturers to keep alert to change and to adjust their policies to such change before it is too late. In machinery, the outstanding trend has been in the direction of increased mill efficiency made possible by high-speed, automatic machinery and other improved equipment. In processes, the major development in all branches of the industry has been the number of new finishes developed to vary and improve the fabric, and its performance.

Among the specific machine and process developments of 1939 were such advances as: the beginning of the use of paper bobbins on cotton spinning frames, a practice which had already gained considerable headway in Europe, the purpose of which is to eliminate spindle vibration under present high speeds; the development of special drawing, roving and spinning equipment for spun-rayon; the introduction of new looms for weaving spun-rayon mixture suiting fabrics; experimentation with continuous dry-cleaning to replace cloth scouring in the wool manufacturing industry, the purpose being to eliminate one of the most common causes of streaky, cloudy and shady fabrics; and the introduction of resin-pigment printing, similar to the method commonly used for printing on paper. The main objective of the latter method is to produce exceedingly sharp prints.

The net conclusion to be drawn from all of these developments in fibres, machines and processes is that the textile industry promises to be in a continuing state of flux in the years ahead. Any one of these developments might produce radical changes in its branch of the industry; all of them operating together could easily create further radical dislocation among sections of the country, units within the industry and competitive relationships with other industries. Theatre.

The more conspicuous events in connection with the American theatre in 1939 were five in number. The first was the abandonment of the Federal Theatre Project. The second was so great a rebirth of interest in the theatre, both in New York and on the road, that in the later months of the year a theatre shortage threatened in the metropolis, with the result that several dormant playhouses were retrieved from the banks and others who had taken them over during the depression and had found them white elephants. The third was the increased rush of Hollywood motion picture players to get a hearing on the legitimate stage. The fourth was the tendency of the Theatre Guild to rely more and more upon outside producers for plays with which to meet its subscription list and the gradual metamorphosis of a once independent producing organization into something little more than an investing partner and booking agency for other producers. And the fifth was the emergence of young William Saroyan, hitherto known only as a writer of short stories, as the likeliest of the native playwrighting newcomers. In the case of both *My Heart's in the Highlands* and *The Time of Your Life*, he provided ample evidence of a fresh, novel, and estimable dramatic talent.

The Drama Critics' Circle could not agree on an American play for its award, the ballots being split among *The Little Foxes*, *Abe Lincoln in Illinois*, *My Heart's in the Highlands* and *Rocket to the Moon*. The critics' award for the best foreign play to be shown in America went unanimously for the second consecutive time to the Irish Paul Vincent Carroll, on this occasion for *The White Steed*, a study of the older and more tolerant church in conflict with modern bigotry. The Pulitzer prize was given to Robert Sherwood's *Abe Lincoln in Illinois*, that already had achieved a large box-office success, which generally, it seems, is an argument in favour of an award on the part of the Pulitzer committees.

The Mercury Theatre, that began auspiciously under the guidance of Orson Welles, went into the discard, at least temporarily, after a succession of feeble productions, Mr. Welles retiring to Hollywood and the radio. The American Theatre Council, organized several years ago to safeguard the American theatre's best interests and embracing various managers, producers and others associated with the stage, added materially little to its past enterprises, its chief concern, the dispensation of theatre tickets to the public at a fair price and the thwarting of ticket speculation, getting but a small step farther in the direction of a sound solution.

Among other points worthy of note were the following: the great success of the Negro songstress Ethel Waters in her first appearance in a straight dramatic role, in the Heywards' *Mamba's Daughters*; the critical demolition and consequent speedy commercial failure of various plays merchanted solely on the basis of pornography; the continued failure in America of plays which had achieved success abroad but which could not meet the tastes of U.S. audiences; and the failure in turn of the newly instituted American Lyric Theatre (designed to give a hearing to meritorious native composers and librettists in the operetta and musical play fields) to meet satisfactorily its own announced ideals, along with its consequent fall from grace—its two presentations, *The Devil and Daniel Webster*, by Stephen Vincent Benét and Douglas Moore, and *Susanna, Don't You Cry*, by Sara Newmeyer and Clarence Loomis, lasting for only six and four performances respectively.

Still other items to be recorded were the continued activity of the Playwrights Company; the death of Sidney Howard, one of its members; the re-emergence of hypothetically dead vaudeville,

KATHARINE HEPBURN (right) scored her first success on the stage in Mar. 1939 as Tracy Lord in Philip Barry's *Philadelphia Story*

chiefly in connection with theatrical revues but increasingly observable through the eastern and middle-western parts of the country; two swing versions of *The Mikado*, the one professional, the other an offering of the Federal Theatre Project, and simultaneously competing with each other; the belated coming into her acting own of Tallulah Bankhead in *The Little Foxes*; the instantaneous and critically deserved collapse of the One-Act Play Repertory Company, which inaugurated its theatrical program with dire specimens of the art; and Maurice Evans' capital revival of Shakespeare's *Henry IV* (Part 1), with himself in the role of Falstaff.

The best new American plays, from a critical point of view, produced during the year were the aforementioned Saroyan's *My Heart's in the Highlands* and *The Time of Your Life*, and Lillian Hellman's *The Little Foxes*. The most amusing popular comedies were *The Primrose Path*, by Robert Buckner and Walter Hart; *The Man Who Came to Dinner*, by Moss Hart and George S. Kaufman, and a dramatization of the late Clarence Day's *Life with Father*, by Howard Lindsay and Russel Crouse. Indifferent new exhibits that achieved box-office success—it must not be overlooked that most of the worthier plays achieved a similar prosperity—were *Mamba's Daughters*, Philip Barry's *The Philadelphia Story* (on the score of Katharine Hepburn's presence in the cast), S. N. Behrman's *No Time for Comedy* (on the score of Katharine Cornell's ditto), Samson Raphaelson's puny *Skylark*

THE MAN WHO CAME TO DINNER, based on imaginary happenings to Alexander Woolcott, was a successful comedy of 1939 winter season on Broadway

(on the score of Gertrude Lawrence's ditto) and Ben Hecht's and Charles MacArthur's trashy *Ladies and Gentlemen* (even more greatly on the score of Helen Hayes's ditto).

The more prosperous new musical shows and revues of 1939 were *The Streets of Paris*, *Too Many Girls*, and *Du Barry Was a Lady*, with the antecedently produced *Hellzapoppin* and *Pins and Needles* continuing their profitable courses.

Finally, and in conclusion, *Tobacco Road* established an all-time high record run for the New York theatre in passing, by a substantial margin, the record of 2,532 performances previously held by *Abie's Irish Rose*. In the last month of the year, it entered upon the seventh year of its engagement. (G. J. N.)

Europe.—The theatrical work of 1939 was temporarily shattered by the outbreak of war in September. There was, however, one respect in which the international situation did affect the theatre favourably: the need for political reconciliations or strengthening of alliances prompted a natural desire for artistic interchange. So it happened that in the spring of 1939 London had official visits from the players of the Comédie Française and of the National Theatre of Greece, while England, under the auspices of the British Council, sent out the "Old Vic" Company to visit Portugal, Italy, Malta, Athens and Egypt.

The French actors and the Greeks were both established at His Majesty's theatre where the former gave Molière and de Musset with brilliance, while the Greeks presented (in modern Greek) the *Electra* of Sophocles and Shakespeare's *Hamlet*. There was an immense critical ovation for the tragic power displayed by the Greeks in both pieces. The same thing occurred in July when Mr. John Gielgud took a company to play *Hamlet* in English in the courtyard of the castle of Elsinore, by invitation of the Danes. Although the same thing had been done two years before by Mr. Laurence Olivier and the "Old Vic" Company, Mr. Gielgud's production and performance were voted the finer.

It was Mr. Gielgud, too, who gave to a sombre season in London its greatest gaiety. That was a most aromatic revival in period style of Oscar Wilde's *The Importance of Being Earnest* in which he led an all-star cast. This took the fancy of the counties as much as of the capital. When the war broke out and the London theatres were temporarily closed for fear of what might come, nearly all the chief London productions were taken on tour. Mr. Gielgud took out his Wilde production, which was most enthusiastically received in north and south.

The "Old Vic" Company was caught by the war in the middle of its Buxton Festival and never came to London for its autumn season. It toured with success: its novelty was a revival of Goldsmith's *The Good-Natured Man*, a too much neglected classic in whose broad humours Robert Donat made a lively return to the stage from the screen. The Malvern Festival was arranged rather late and provided some disappointments. Its chief feature was the new play by Mr. Bernard Shaw, *In Good King Charles's Golden Days* which turned out to be a historical conversation piece collecting such famous 17th century figures as George Fox the Quaker, Queen Catherine, Nell Gwynn and other ladies of the king's fancy, Sir Godfrey Kneller and Sir Isaac Newton for colloquy on matters of government, philosophy and art with witty, prudent King Charles II and his foolish, turbulent brother James. There was no action in the piece, but it was Shavian palaver of the best. A new Festival was added to the list. In a difficult year the players of Perth made a brave and well rewarded beginning to attract the general attention.

Noel Coward was represented in 1939 by a comparatively old piece, not hitherto acted in England, *Design for Living*, and Benn Levy by *The Mulberry Bush*, a clever but too diffuse pre-war play about the battle that came. There was general praise of a fascinating piece about Irish land and Irish peasants, called

Bridge Head, written by Rutherford Mayne. In it that very powerful actor Wilfred Lawson once more demonstrated his power. J. B. Priestley's contribution to the year was a metaphysical fancy about the life after death of an average sensual man, called *Johnson Over Jordan*. Its total merit was disputed, but its intermittent force and beauty were generally conceded. (I. Br.)

Thomashefsky, Bores (1868-1939), American Yiddish actor who introduced the Yiddish theatre to the United States, was born at Kiev, Russia on May 12, of parents who were exiled when he was 13 years old. They went to New York city, where Thomashefsky worked in a cigarette factory and, at the early age of 14, arranged for an appearance of a Yiddish acting company from London. After a brief theatrical experience in Chicago, he settled again in New York city, where he began to write plays in Yiddish (nearly 500 in all) and to appear in all sorts of productions from musical comedies to Yiddish translations of Shakespeare. He was sufficiently successful to build his own theatre, the National, on the East side, where he introduced such famous actors as Bertha Kalich (*q.v.*), Joseph Schildkraut, Jacob Ben-Ami and Rebecca Zuckerberg, whom he later married. Thomashefsky continued his appearances on the stage until only a few weeks before his death in New York city on July 9.

Thomson, Sir Basil (1861-1939), British investigator and police official, noted for his consistent success in apprehending German spies in England during the World War, was born on April 21 and was educated at Eton and Oxford. He was for a time prime minister of Tonga in the South Pacific, then returned to England to become an expert penologist. He was assistant commissioner of the London metropolitan police from 1913 to 1919, engaged primarily in combating espionage, and director of intelligence from 1919 to 1921. Among his published works are *South Sea Yarns* (1894), *The Criminal* (1925), *The Story of Scotland Yard* (1935) and several novels. He died in London March 26.

Tibet, a country of central Asia, lying N. and N.E. of the Himalayas, mainly a high tableland. Nominally a Chinese dependency, it is in practice independent. The area is about 450,000 sq.mi.; estimates of the population vary from 750,000 to 6,000,000; 2,000,000 is probably near the truth. The religion is Lamaism and education is carried on by the many monasteries.

At last an authentic reincarnation of the Dalai Lama has been discovered after a three years' search, and has been officially recognized by the Viceroy and Government of India. He is the son of peasants, Lhamo Dhondup, born in Dec. 1933 near Kumbum, a lamasery in the Chinese province of Kansu some 50mi. east of Lake Koko Nor, and was found living in a cave. Proof of his identity was furnished by various miracles, and after a journey of nearly three months he was welcomed in Lhasa with great rejoicing and full ceremonial ritual on October 8.

The acceptance by the Tibetans of Lhamo Dhondup (who later became Lingerh Lamutanchu), as well as the actual journey, was strongly forwarded by the Chinese authorities, and it is probable that another effort will now be made to reassert Chinese influence over Tibet which, owing to Tibetan resistance, has waned in recent

LINGERH LAMUTANCHU, a Chinese boy, was chosen 14th Dalai Lama of Tibet in 1939. He was born Dec., 1933.

years. The future of the country, and of its ruler, is, however, uncertain; the former because there is a powerful Nationalist party working towards the transformation of Tibet into a modern state, and the latter because in the past Dalai Lamas—the 13th, who lived to a good age, being an exception—have usually died mysteriously before reaching manhood.

During the year 1939 German and Italian scientific expeditions visited the country, and much valuable geographical research work was carried out; the Germans also claim to have discovered the "shape," an animal allied to the Himalayan wild goat, the tahr, and hitherto met with only in Tibetan folklore.

In September, gambling, the use of tobacco, and "chang," a very potent native drink, were forbidden; the latter ban being imposed principally in the interests of the conservation of barley.

Timber: see LUMBER.

Tin. In 1938 world tin production decreased 29% from 1937 and 23% below the high point of 1929, to 148,700 long tons. All of the major producing countries showed material decreases with the exception of Bolivia and China; most of the intermediate producers, with outputs of 1,000–10,000 tons, likewise shared in the decrease, but some of these as well as of the minor producers showed a little improvement. Production to the end of Aug. 1939 totalled 87,000 tons, but war demand probably increased the output of the remaining four months to about the same amount. The accompanying table gives the details of output for the leading producers, accounting for about 90% of the current total.

British Empire production of tin covers nearly one-half of the

World Production of Tin
(Long tons)

	1929	1933	1936	1937	1938
Belgian Congo . .	1,000	2,200	7,300	8,900	7,300
Bolivia	43,300	14,700	24,100	25,100	25,400
China	6,800	9,500	10,700	10,500	11,200
Dutch E. Indies . .	35,200	12,600	31,600	39,800	21,000
Malaya	69,400	24,900	66,800	77,500	43,200
Nigeria	10,700	3,800	9,600	10,500	7,300
Siam	10,500	10,300	12,700	16,500	13,500
World total . . .	193,000	91,000	180,000	208,000	148,700

world total, but in Great Britain itself the output is only about 2,000 tons annually; aside from the main sources in Malaya and Nigeria, other British territory in Africa produces about 1,600 tons, Australia 3,300 tons, and Burma 4,000 tons.

Although the United States has no appreciable tin output, the country is the world's largest consumer, having during the past 25 years imported amounts averaging 46% of the world output, and in addition has supplemented these imports with secondary tin recovered from previous use, to the extent of 35% of the amount of new metal used. In 1938, imports declined sharply from the record level of 88,000 tons in 1937, the total being 49,700 tons, increasing to 49,800 tons for the first 10 months of 1939.

In order to avoid adverse effects on the world market, the British Ministry of Supply removed all price restrictions in an order effective December 11; about the same time export quotas for the first quarter of 1940 were raised to 120% of the standard tonnage (208,940); during 1939 the quotas were: first quarter 35%; second quarter 40%; third quarter 120%; fourth quarter 100%.

In November it was announced that the Phelps Dodge Refining Corporation and the American Metal Company were building plants in the New York area for the treatment of Bolivian ores, diverted from European smelters now in the war zone. (See also MINERAL AND METAL PRICES AND PRODUCTION.) (G. A. Ro.)

Tiso, Josef (1887–), Slovakian politician and ecclesiastic. He was ordained a Roman Catholic priest in 1909 and after the end of the World War became engaged in Slovakian nationalist politics under Andreus Hlinka. After Father Hlinka's death Aug. 16, 1938, Tiso became leader of the Slovak People's party.

When Czecho-Slovakia granted the Slovaks their long-desired autonomy in Oct. 1938 after the pact of Munich, Tiso became prime minister and chief delegate to the Komarom conference which redefined the Hungarian-Slovakian frontier. On March 10, 1939 Tiso was suddenly ousted by the Czech Government; he appealed to Hitler for assistance and four days later Slovakia proclaimed its independence. Tiso was reinstated as prime minister, and on March 23 Slovakia signed a treaty by which Germany guaranteed its political integrity for 25 years, at the same moment that Hungarians were invading its eastern frontier. On August 18 Germany assumed military control over Slovakia, and 12 days later Tiso proclaimed German military rule. On October 26 Tiso was elected first president of the Slovak republic. (See also SLOVAKIA.)

Titanium. Both ilmenite and rutile are utilized as sources of titanium, although the former furnished most of the supply; rutile is probably mined not to exceed 1,000 tons a year, while the figure for ilmenite has grown to something like 275,000 tons. India and Norway are the chief producers, with small amounts from Senegal, Canada, Portugal, Brazil, and Egypt. Although some titanium is used as an alloying agent in steel, the

great expansion in demand that has come during the past few years resulted from the development of titanium pigments for paint and ceramic work. Imports of titanium ores into the United States in 1938 totalled 201,500 short tons, as compared with 43,300 tons in 1933. (G. A. Ro.)

Tobacco. The United States tobacco crop of 1939 was estimated by the Department of Agriculture November 1 as the largest on record, 1,659,409,000lb., slightly larger than the previous record of 1930 and comparable to a 1938 crop of 1,378,534,000 pounds. The yield was also a record, 920-6lb. to the acre as against 860-1lb. in 1938 and the previous highest yield, 902-6lb. in 1935. Offsetting this bumper production, however, were the narrowing wartime market restrictions. In April, Great Britain increased the import duty on leaf tobacco by two shillings a pound and on September 28 a second advance of two shillings (about 40¢) was added to all tobacco imported into the United Kingdom either from foreign countries or Empire sources. This made the British import on United States leaf 13s., 6d. a pound (about \$2.70). Or, about 14¢ on a package of 20 cigarettes, comparable to the six cents of the U.S. internal revenue tax. Most other large producing countries had smaller crops in 1939 than in 1938. In Canada the official estimate September 1 was 94,664,000lb. as against 98,340,000lb. despite an acreage increase of 67,408ac. in 1939 compared to 63,150ac. in 1938. Of the 1939 crop about 69,000,000lb. was flue-cured, compared to 75,145,200lb. in 1938. In China consular reports placed the 1939 crop at 115,000,000lb., a substantial decline from 1938. Difficulty in obtaining coal prevented flue-curing of a large part of the crop. In territory controlled by Japan sale of British tobacco products was prohibited and effort was made to keep the trade in Japanese hands, the Japanese putting into operation at Kalgan a new cigarette factory with a capacity of 800,000,000 cigarettes a year. The tobacco crop in the Japanese Empire was estimated at 98,535,000 pounds. Preliminary estimates of the Manchurian crop were 25,000,000lb. approximately double 1938 production. Wet weather and low temperatures reduced production from 17,931,000lb. in 1938 to 12,700,000lb. in 1939 in Nyasaland, the principal tobacco producer of East African colonies and the United Kingdom's oldest colonial source of tobacco. In Australia the 1938-39 crop was 3,922,000lb. compared to 5,980,000lb. the preceding year.

In the United States 1939 production of flue-cured tobacco was estimated at 1,019,510,000 pounds. The flue-cured crop was 785,731,000lb. in 1934. The ten-year average (1928-37) was 704,802,000 pounds. Fire-cured tobacco in 1939 was estimated at 96,146,000lb., and 84,324,000lb. in 1938. The 1939 crop was about 31% under the ten-year average. Dark air-cured types of tobacco were 36,927,000lb. in 1939, and 32,789,000lb. in 1938, the ten-year average being 44,494,000 pounds. Burley tobacco production was estimated at 350,669,000lb. compared to 338,789,000lb. in 1938 and a ten-year average of 315,689,000 pounds. In November, 89,123 burley growers voted for and 17,710 voted against Agricultural Adjustment Administration quota control of the 1940 burley crop. About half the burley growers voted.

Tobacco Production (All Types) by States, 1938 and 1939

	1939 lb.	1938 lb.		1939 lb.	1938 lb.
North Carolina	606,525,000	516,850,000	Connecticut	25,224,000	16,223,000
Kentucky	313,646,000	292,175,000	Florida	22,335,000	19,684,000
Virginia	130,108,000	98,906,000	Massachusetts	9,881,000	6,786,000
South Carolina	118,750,000	98,800,000	Indiana	9,704,000	9,583,000

Tobago: see WEST INDIES, BRITISH.

Todd, David (1855-1939), American astronomer, was born at Lake Ridge, N.Y., on March 19. He took his bachelor's and master's degrees at Amherst college and his doctorate at Washington and Jefferson college in 1888. While still a graduate student at Amherst he was appointed to the U.S. Transit of Venus commission and was chief of the U.S. Naval observatory eclipse parties in Texas in 1878. From 1881 to 1920, when he retired, he was professor of astronomy and navigation and director of the observatory at Amherst. The year after this appointment he was invited by Lick observatory to take charge of observations of the transit of Venus. He led eclipse expeditions to Japan, Tripoli, the Dutch East Indies, Russia and South America and was the first man to take an aerial photograph of the solar corona during eclipse, at Mitchel Field, L.I., in 1925. Among the best known of his many astronomical photographs were those of Mars taken from a temporary observatory 16,000ft. up in the Andes of Northern Chile in 1907. Todd died at Madison Heights, Va., on June 1.

Togoland: see BRITISH WEST AFRICA.

Tokyo, capital of Japan, population (1937) 6,274,000; area 257 sq.mi., situated at 35° 41' N. and 139° 45' E. at the head of the bay of the same name on the south-east coast of Honshu, the main island of Japan.

Tokyo is served by an extensive system of tramcars, buses and city railways. A subway is under construction and the part which has already been completed serves a section of the central districts of the city. A further section was opened for traffic in the autumn of 1938. It is a self-governing municipality, governed by an elected common council and board of aldermen. A good deal of executive authority is vested in the mayor, who is elected by the common council. As the capital of the empire, Tokyo is the place of residence of a large number of Government officials and civil servants. It is also Japan's largest educational centre, the Kanda Ward being largely a students' quarter. As of March 1, 1935, Tokyo had 22 universities, with 46,625 students and 72 professional schools, with 52,165 students. Tokyo and its environs rank as one of Japan's four great industrial regions, the others being Osaka, Nagoya and North Kyushu. At the end of 1936 there were in Tokyo 13,326 factories, employing more than five operatives, with 329,439 workers. There were 29,544 small workshops, employing less than five persons, with 47,279 workers. A feature of Tokyo is the extremely large number of small shops of all kinds. There were 164,438 of these at the end of 1936. (W. H. CH.)

Toller, Ernst (1893-1939), German dramatist, was born in Samotschin, Prussia, of a Jewish family on December 1. He served for a while in Flanders with an artillery regiment during the World War but was invalided out of the army and returned home. For his part in the Munich revolution of 1919 he was imprisoned in a fortress for five years, during which time he wrote many of his most famous works, including *Masse-Mensch* (1921, translated into English in 1923), a revolutionary drama smuggled out of Germany and presented by the Theatre Guild in New York city as *Man and the Masses*. His last play, *Pastor Hall*, was published only a few weeks before his suicide May 22, 1939, in New York city, where he had resided in exile. For a description of his other works, see *Encyclopædia Britannica*, vol. 22, p. 272.

Tomatoes. Production of tomatoes for commercial processing in 1939 in the United States was 1,925,500

short tons, compared to 1,742,600 short tons in 1938 and a ten-year (1928-37) average of 1,458,000 short tons. The acreage of tomatoes harvested for processing was 347,020 in 1939, and 392,350 in 1938, with a ten-year average of 356,980 acres. Prices for tomatoes for processing averaged \$12.30 per ton in 1939. In 1938 it was \$12.41 per ton. The average price for the ten-year period was \$12.72. Production of commercial tomatoes in the United States for fresh marketing was 24,585,000bu. in 1939 compared to 24,724,000bu. in 1938, and a ten-year (1928-37) average of 18,707,000 bushels. The acreage of the crop for fresh marketing was 210,450 in 1939 compared to 218,700 in 1938 and a ten-year average of 169,660 acres. Production of tomatoes:

	1939	1938	Average 1928-37
Fall	556,000bu.	350,000bu.	356,000bu.
Early (1)	2,880,000bu.	2,945,000bu.	1,448,000bu.
Early (2)	3,713,000bu.	3,562,000bu.	2,048,000bu.

Toronto, with a population of 647,803 (1938) and an area of 34 sq.mi., is the second largest city of Canada and capital of the Province of Ontario. It is greatly concerned in the industries of manufacturing and mining and in the distribution of goods, and for the last-named purpose is advantageously situated on the line dividing the population of Canada as between East and West. Communications by land, water and air are good. The University of Toronto, with some 7,500 students, is said to be the largest university in the British Empire and has become world famous in teaching, in research, and in the advancement of science. The corporation of the city of Toronto owns the street railway and motor bus transportation, the waterworks system, and the local hydro-electric system which has exclusive distribution of electricity for light, heat and power. The Canadian National Exhibition, now in its 62nd year, is a great annual event attracting 1,650,000 visitors in 1939. The well-known Royal Winter Fair, with its agricultural, livestock and horse show, held annually, grows steadily in importance. Toronto, in common with the rest of Canada, welcomed the visit in the summer of 1939 of Their Majesties, the King and the Queen. (G. R. G.)

Town and City Planning. The International Congress for Housing and Town Planning was held in July of 1939 in Stockholm, Sweden. Housing projects were carried on in most of the larger countries of Europe and America, in some places making a maximum use of planning and in others ignoring regional planning problems and making scanty use of modern planning lay-out. Great Britain announced the 4,000,000th house built since the World War and the total clearance, under slum reclamation, of 236,000 houses, reflecting a displacement of nearly 1,000,000 persons. The English public housing projects generally received the benefit of expert planning. In the United States an extensive public housing program was authorized by the newly created U.S. Housing Authority, under the Act of 1937 which supplemented previous housing projects

THE CITY OF 1960, as envisaged in a General Motors exhibit at the New York World's Fair in 1939, will have widely spaced skyscrapers of 150 stories, double-decked streets, and parks on the roofs of low buildings

under the Public Works Administration and the Department of Agriculture.

Planning restudies of metropolitan and rural areas were under way in Great Britain in the Lake district, Yorkshire, and Sussex. Birmingham was the first of the English cities to provide parking and air-raid shelter, but the exigencies of war have made this necessary in all exposed English cities. The English Camps Act of 1939 authorized the construction of permanent camps to be used by schools in peacetime and available for evacuation in wartime. In Paris, before the war, progress was made on a plan for the development of rural areas in the metropolitan district, to be integrated with the city plan.

In Germany plans were made to develop Nuremberg as a political centre and to preserve the amenities of the old town. Revised street plans were under way in Hamburg, where a five-year plan involved street widenings and the provision of several thousand parking places, and in Brussels, where the north and south railway stations are being connected by an underground tunnel, with subterranean garages over the tunnel. Comprehensive replanning of Naples and Milan has been undertaken.

There was great activity in the United States to revise planning and zoning laws from 10 to 20 years old. The New York City Planning Commission, authorized in the city charter, adopted in 1937, and given more definite duties and powers than in most American cities, issued a bulletin on major reports of the commission. By official ordinance Chicago set up a planning commission of 22 members with an advisory board of 200. New York appropriations for the planning commission are in a class by themselves, but a study of appropriations in 1938-39 for city planning commissions in the 17 cities of the United States with 500,000 population or over, showed that 15 made budget provision of \$10,000 to

\$50,000; of the 25 cities from 200,000 to 500,000, 12 appropriated \$5,000 to \$13,000; but there was a rapid falling off in appropriations for the smaller cities. Many made no appropriations at all.

There is indication that many of the countries are paying increased attention to the conservation of their natural scenery, as witnessed by the plans in Copenhagen, based on the Danish town planning law of 1938, with due regard for the law for preservation of nature passed in 1937. Many countries are building super-highways to connect principal cities. In Denmark a diagonal highway is being built from the interior to the port of Esbjerg-Harwich steamship line, providing an important transport link with England; in U.S.S.R. a fine new road is being built from Moscow to Minsk of which some 400 mi. were put into use in 1939; in Poland, the first motor road was projected from Warsaw to Lodz, but the war has no doubt thwarted that plan; in Japan, the ministry of the Interior has decided to build a 600-mi. motor road, after the German pattern, from Tokyo to Fukuoka, to pass through a submarine tunnel at Kamoun, under construction in 1939. There is under construction a new international highway over the St. Lawrence between Canada and the U.S., with nine miles of bridges built to avoid interference with shipping. In the United States, Great Britain, France, Germany and other countries, where excellent highway systems have been developed, roads were improved, shortened and re-routed. In the United States there was completed and put into use one-third of the 500-mi. Blue Ridge parkway connecting Shenandoah and Great Smoky Mountains National parks. Plans progressed on the Natchez Trace parkway which will connect Nashville with Natchez. These, with the George Washington Memorial parkway from Mt. Vernon to Great Falls in the Washington metropolitan region, including the completed section from Washington to Mt. Vernon, will provide three Federal parkways aggregating nearly 1,000 miles. Following the pattern set by Westchester county, N.Y., the opening in 1939 of the Merritt parkway in Connecticut, used in connection with the Saw Mill parkway, and the Hendrik Hudson parkway running along the river the full length of New York city, provided direct through motor dispatch from New England to the South.

In the United States the two World Fairs—one at San Francisco and one at New York city—made distinct contributions to planning in their own construction. In addition, at the New York Fair, General Motors presented Futurama, a bold conception of the city of the future, as planned by Norman Bel Geddes. At the New York Fair, too, the American Institute of Planners presented the moving picture of "The City," financed by the Carnegie Corporation. (See also HOUSING; ROADS AND HIGHWAYS.)

BIBLIOGRAPHY.—Books and bulletins published in English on planning subjects late in 1938 and during 1939 include: Edward M. Bassett, *The Master Plan* (1938); Frederick P. Clark, *Your Home Town* (1939); Harold M. Lewis, *City Planning, Why and How* (1939); Lewis Mumford, *The Culture of Cities* (1938); Stuart Alfred Queen and Francis Thomas Lewis, *The City, a Study in Urbanism* (1939); Bernard Smith, *Town Building* (1939); T. F. Thomson, *A Short Guide to Planning Procedure* (London); Rexford G. Tugwell, "The Fourth Power," Part II of *Planning and Civic Comment* (April-June 1939); U.S. Nat'l Resources Committee, vol. 1 of *Supplementary Report of the Urbanism Committee* (1939); Mabel Walker, *Urban Blight and Slums* (1938). Track and Field Sports. The Olympic Games, scheduled to be held in Helsinki in 1940,

have been cancelled because of the European war.

Not only in Finland, with Taisto Maki breaking five world records, surpassing the exploits of Paavo Nurmi, but also in England and in Germany native athletes made assaults on world records, as did American athletes on tour abroad in the summer of 1939. Next to Maki in achievements was Sydney Wooderson, the small London bank clerk who created a new world record for the three-quarter-mile run and established a new British record in the one-mile run, the fastest run last year in any stadium. Rudolf Harbig, a Nazi middle distance star, bettered two world records, and Lutz, another Nazi, broke the world hammer mark. An American 3,200-metre relay team set up a new world mark, and Chuck Fenske (U.S.A.) accounted for a new world mark for the 1,000-yd. run, an odd distance not recognized by the International Federation. As indoor performances are not acceptable by the Federation, the new world (U.S.A.) marks set up by John Borican in three races, the Fordham one-mile relay record, and the pole vault of Cornelius Warmerdam, will stand as a matter of recording only. Glenn Cunningham was America's one-mile ace indoors for the eighth year.

To Maki, the Mercury-winged Finn, go laurels for slashing the two-mile record 2-8sec., to 8min. 53-2sec.; three miles in 13min. 32-4sec.; 5,000 metres in 14min. 8-8sec.; six miles in 28min. 55-6sec.; and 10,000 metres in 29min. 52-2sec., thereby clipping from 8-2 to 13-2sec. from records made by Olympic champions.

Wooderson's new British mile record in 4min. 7-4sec. was followed by new world record time of 2min. 59-5sec. for the three-quarters. Ten days later he attempted to reduce the mile world record in Princeton, N.J., in a race that jarred the athletic world because of the unavoidable crowding by Blaine Rideout. Wooderson was forced to cut short one stride, which made little or no difference to the outcome of the race. Sports authorities are of the opinion that his slow pace up to that time prevented a new world record and favoured his American rivals to win in the rush to the finish line, which they did, in the off-record time of 4min. 11sec., won by Chuck Fenske, of Wisconsin. Cunningham took second, San Romani was third, Rideout ran fourth, and Wooderson fifth and last of the field.

Wooderson had not lost a race abroad in three years and had broken four world records in 22 months.

Harbig's records are dazzling because he covered 400 metres in 46sec., and ran 800 metres in 1min. 46-6sec., three full seconds faster than the previous record of Elroy Robinson (U.S.A.). Lutz, the Nazi hammer thrower, earned his world record by a heave of 193ft. 9½in., bettering the mark of Paddy Ryan, made in 1913, by more than four feet. The indoor "rejects" by the Federation are Fenske's new world time of 2min. 9-3sec. for 1,000yd.; John Borican's indoor marks of 800 metres in 1min. 49-2sec., 880yd. in 1min. 49-8sec., and 1,000yd. in 2min. 8-8sec.; the Fordham one-mile relay time of 3min. 15-2sec., and the pole vault mark of 14 ft. 6½in. by Cornelius Warmerdam.

In a survey by the Amateur Athletic Union, the summary shows Americans as winning the "Paper Olympics of 1939." The athletes of the United States outscored the others with 209 points, 108 for Finland, 74 for Germany, 28 for Norway, and so on.

The American A.A.U. outdoor championships at Lincoln, Neb., uncovered many unexpected upsets, with 11 of 18 of the former champions dethroned, including the New York A.C. as team winner, bowing to the Olympic Club of San Francisco. Blaine Rideout got away to a long lead in the 1,500 metres and won from Glenn Cunningham, Fenske and San Romani, in that order. Fred Wolcott, of Rice university, ran the 200-metre hurdle race around a turn in 22-9sec.; J. Gregory Rice, of Notre Dame, smashed the 5,000-metre meet record in 14min. 50-9sec.; Phil Fox, of Olympic Club, sent the discus 172ft. 4½in., the best by an American; the

N.Y.A.C. 400-metre relay team broke the meet record in 41 seconds. With a helping wind, Clyde Jeffrey, of Olympic Club, equalled Jesse Owens's world record of 10.2sec. for 100 metres, and that time was equalled by Jeffrey Ellerbe, of Tuskegee; Herbert Thompson, of Jersey City, and Norwood Ewell, of Penn State, did 10.3sec., bettering the meet standard of 10.4, but these four under-par marks were disallowed. Fred Wolcott and Joe Batiste won in the 110-metre high hurdles event, in 13.8 and 14.1sec., respectively, both under the record of 14.2, but were also denied the new marks because of the wind.

The national A.A.U. decathlon championship, a supreme test in 10 events, was won by Joe Scott, of Western Reserve, by a wide margin, and the national pentathlon title, for a five-event contest, was won by John Borican against a fast field. In short-distance walking events the performances were below standard; in longer distances, John Rahkonen, a Finn, was a triple winner, leading in the 15,000, 30,000 and 40,000 metres events; Albert Cicerone led in the 20,000 metres walk, and Ernie Crosby won the 50,000 metres walk (31½mi.), the Olympic distance, in 5hr. 19min. 33.3sec., about 49½min. behind the Olympic record of Whitlock, of England, in the 1936 Olympics.

Indoors, track and field sports attracted large audiences in New York, Chicago, Boston, and other cities. Five new meet records were established and one citizen record reduced in the A.A.U. championships in Madison Square Garden, New York. Herbert Thompson equalled the 60-metre record of 6.6sec.; the new records were Alan Tolmich's 65-metre hurdle race in 8.4sec.; Don Lasb's 5,000 metres in 14min. 30.9sec.; the 1,600-metre relay in 3min. 17.2sec., by the 69th Regiment team; the 2,900-metre relay record of 7min. 8.3sec., by the New York A.C. team. The N.Y.A.C. also retained its team title in the 16-event program.

The two major collegiate track fixtures, the Penn Relays and the Drake Relays, held at Philadelphia and Des Moines, respectively, brought out many future Olympians. At Philadelphia foot racers of Pitt flashed to two breath-taking finishes in winning the 440-yd. relay and the one-mile relay—first beating Cornell in 42.3sec. in a dazzling blanket finish, and then when John Woodruff, rangy Negro, ran the half-mile anchor leg in 1min. 51.2sec. to mow down the N.Y.U. and Fordham teams. North Texas State retained its distance medley title in the 2½-mi. event.

Spectators at the Drake Relays saw record-breaking performances during the big two-day carnival that brought a field of 2,000 athletes from the entire U.S. The crack sprint relay team of Rice Institute lowered the meet record by covering the mile in 3min. 25.1 seconds. Rice athletes equalled the 440-yd. relay record in 41.5 seconds.

Europe.—Track and field sports on the Continent went forward with characteristic progress until the outbreak of the European war in September. In England, running and the name of Sydney Wooderson are synonymous. From the beginning of the season all indications pointed to a new world record in the one-mile event, particularly after Wooderson turned in his 4min. 7.4sec. mile on Whit Monday, and covered the three-quarters in the fastest time that man has ever run the distance, in 2min. 59.5 seconds. (This is the first time that anyone has ever been clocked under three minutes, the new time being 8/10sec. under the 3min. 0.3sec. record of Rideout, of North Texas college, U.S.A.)

In the International Meet in London against 15 nations, a team of 10 American athletes carried off major honours, winning eight first places in the 14 events. Roy Cochran (U.S.A.) won the 440-yd. hurdles in 52.7sec., a new British record. Clyde Jeffrey (U.S.A.) won both the 100- and 220-yd. dashes. Bill Watson (U.S.A.) was the high point scorer, breaking the English shot put record, with 52ft. 8in., winning the broad jump with a leap of

24ft. 6 in., and scoring third in the discus. Charles Beetbam tied the British record of 2min. 11sec. for the 1,000-yd. race, in Glasgow.

In Paris the American track team defeated a favoured French team in the two-mile relay, establishing a new world record of 7min. 35.2 seconds. Fifty new records, among them three world records, were chalked up for Germany's athletes during 1939. Harbig's 400- and 800-metres records, and Christel Schulz's long jump of 6 metres 12 centimetres are the three world records.

World's Best Track and Field Performances of 1939

100 Yards	10,000 Metres
9.5 sec.—Greer, United States	29 min. 52.3 sec.—Maki, Finland (World Record)

Tractors: see FARM MACHINERY.

Trade Agreements. During 1939, U.S. trade agreements were signed with Turkey (April 1) and Venezuela (Nov. 6) bringing to 22 the number of agreements signed under the authority of the Trade Agreements Act of 1934 (not including two supplemental agreements with Canada and Cuba). The most important agreement, both by reason of the

value of trade involved and by reason of its telling influence upon the commercial policies of the great trading nations of the world, is the agreement between the United States and the United Kingdom, signed on Nov. 17, 1938. On the same day was signed a second trade agreement with Canada.

The United States commerce with the British Empire constitutes

roughly about a third of its total foreign trade. The United Kingdom is the United States' largest customer. In 1929 the U.S. sold to the United Kingdom goods valued at \$848,000,000; in 1938 the value of the exports had dropped to \$521,000,000. American farmers have a particularly vital stake in English markets, for approximately a third of the total agricultural exports are sold in the United Kingdom.

After the United Kingdom, Canada buys more goods from the United States than any other country. Taken together, the concessions embodied in the two agreements cover more than 3,000 tariff items. The U.S.'s total exports to and imports from the areas concerned amounted in 1937 to \$2,025,322,000. Of this total, 68%, or \$1,377,422,000 worth of trade, is covered by the concessions given and received. The exports and imports of the areas included in the agreement between the United States, United Kingdom and Canada account for over a third of the total international trade of the world. Both the United Kingdom and Canada in these agreements have notably modified their policies of protection and preference, and have joined with the United States in a policy of trade liberalization.

In view of the fact that the trade of the United States and of the areas now covered by U.S. trade agreements constitute more than 60% of the foreign trade of the world, it is evident that the American program, built upon the sound principle of lowered trade barriers and non-discrimination, and designed to counter the crippling and provocative trade practices which followed the economic crash of 1929, is proving practical and effective.

The U.S. trade agreements program grew out of the conditions and needs resulting from the world depression following 1929. Nations had entered into feverish competition with each other to sell to foreigners a maximum and to buy from foreigners a minimum of goods. Trade barriers had been built up to unprecedented heights. To constantly mounting tariff walls were added entirely new economic devices for regulating trade—quota restrictions, exchange controls, Government trade monopolies and export and import licensing requirements. The trade highways of the world became blocked with impassable barriers. International trade fell to a third of its 1929 value. From 1929 to 1933 the value of U.S. foreign trade fell from \$9,640,000,000 to only \$3,125,000,000. The resulting economic and social dislocation was the cause of widespread suffering and increasing national problems.

To meet this national emergency, legislation designed to increase U.S. foreign trade was worked out upon the basis of three principles of tariff making, each of which had been separately adopted heretofore in U.S. legislation, but which in combination were entirely new. The three principles are these: (1) Congressional delegation to the President of the power of tariff adjustment within prescribed limits. (2) Tariff negotiation by

executive agreement. (3) Generalization of all tariff reductions (except those granted to Cuba) to the products of all countries which do not discriminate against American commerce.

The Trade Agreements Act, signed on June 12, 1934, offered a new program based upon these three accepted principles. The act authorized the President "for the purpose of expanding foreign markets for the products of the United States" (1) "to enter into foreign trade agreements" and (2) "to proclaim such modifications of existing duties . . . or such additional import restrictions, or such continuance . . . of existing customs or excise treatment of any article covered by foreign trade agreements, as are required or appropriate to carry out" such agreements. The President may not modify existing customs duties beyond 50% nor may he transfer any article between the dutiable and the free lists. The duties thus proclaimed by the President are made applicable to the products of all countries, except that the President may suspend their application to the products of any country "because of its discriminatory treatment of American commerce or because of other acts or policies" which tend to defeat the purposes of the act. The exceptional situation of Cuba is recognized by a provision for an exclusive preferential agreement with Cuba, thus continuing the preferential relationship established by the Commercial Convention of 1902.

The trade agreements program, designed to combat existing world tendencies toward economic nationalism, has a two-fold objective. It seeks, first, the reduction or elimination of excessive trade barriers. Trade barriers such as impede international commerce cause diminished national incomes, depressed standards of living, increased unemployment, financial instability and social unrest. The second objective of the program is the elimination of trade discriminations. Trade discriminations lead to constantly shifting trade currents, commercial uncertainty and insecurity, recriminations and retaliations, trade conflict and the kind of economic tensions that can lead to war.

The success of the program has been marked. During the five-and-a-half years after its inauguration, agreements were concluded with 21 countries (two with Canada). Announcements have been made of intention to negotiate a revised agreement with Belgium and an agreement with Chile. The proportion of total United States trade which is conducted with trade agreement countries is indicated in the chart at the top of the page.

The influence of the trade agreements program in stimulating the foreign trade of the United States is indicated in the chart below which shows the increase during the two-year period of 1938 and 1939 over the two-year period of 1934 and 1935 of exports to, and imports from, trade agreement countries as compared with other countries.

INCREASE IN UNITED STATES EXPORTS AND IMPORTS under the trade agreements program. The chart shows increase of 1938 and 1939 (average) over 1934 and 1935 (average). Last two months of 1939 estimated

The effects of the program are world-wide. With the powerful leverage which it affords, the United States has been able to make definite progress in countering the world movement toward economic nationalism and trade discrimination. (See also *INTERNATIONAL TRADE; TARIFFS.*) (H. F. G.)

Trade Unions: see *LABOUR UNIONS.*

Traffic Accidents. The downward trend of the automobile accident rate in the United States, based on deaths per 100,000,000 vehicle-miles, which began in 1934, continued through 1939 with a 7% reduction from the rate of 1938. The rate in 1939 was 11.5. In lives lost in traffic accidents there was a 2% reduction in 1939 from 1938.

This progressive march toward safety on the streets and highways of the country was attributable to the constantly increasing effectiveness of the administration of traffic safety functions by city and State officials who were backed up by civic and professional groups and the people at large.

Outstanding achievements in the field for 1939 may be grouped under the seven headings of the model highway safety program which was drafted and endorsed by 12 leading organizations interested in safety in the United States. The seven points and major achievements under them are as follows:

Legislation.—Continued adoption by States of all or parts of the Uniform Motor Vehicle Code and by cities of the Model Municipal Traffic Ordinance, both of which were drafted by the National Conference on Street and Highway Safety.

Motor Vehicle Administration.—Improvement in motor vehicle administration in States with more adequate accident reporting systems, better examinations for new drivers, and the more efficient suspension and revocation of drivers' licences for cause.

Enforcement.—Rapid spread in cities and States of the investigation of accidents and of selective enforcement, as recommended by the Safety Division of the International Association of Chiefs of Police.

Engineering.—Completion of the Highway Planning surveys by the Public Roads Administration in collaboration with State highway departments.

Education.—Preparation of the 1940 yearbook of the American Association of School Administrators which is entirely devoted to safety education in schools; co-operation of more than 100 teachers' colleges and universities in conducting credit courses in safety education during the summer of 1939; and publication of adequate school courses in safety by eight State departments of public instruction, thus bringing to 37 the number of States with such courses.

Training Personnel.—Training of about 150 traffic officers in both short and long courses by the Northwestern University Traffic Institute; training of almost 500 traffic officers by the Safety Division, International Association of Chiefs of Police; training of more than 50 teachers in safety education by the National Center for Safety Education at New York university; training of 40 traffic engineers at the Yale Bureau for Street Traffic Research.

Research.—Publication of a study entitled "Installing Tests for Intoxication" by the National Safety Council and the continuation of the exhaustive study of enforcement methods by the National Committee on Traffic Law Enforcement under the chairmanship of Arthur T. Vanderbilt.

Among the organizations most active in the safety field during 1939, in addition to those already mentioned, were the Automotive Safety Foundation, American Automobile Association, and the National Conservation Bureau.

Great Britain.—Fatal accidents during the first eight months of 1939 approximated the number during the corresponding period of 1938, according to the Ministry of Transport. If this rate had continued through to December 31, the 1938 toll of 6,440 deaths would have been about equalled. On November 3, the Ministry stated that it was "too early to form any reliable estimate of the effect of war conditions upon traffic conditions and the accident rate," but in December it was reported by reliable sources that during the first three months of the war no fewer than 3,000 persons had lost their lives on the streets and highways in Great Britain. This great increase was accounted for by the "black-outs"; for on September 1, Order No. 1098, relating to restrictions on lighting, was promulgated under the Defence Regulations. The order drastically restricted vehicle and road illumination. (F. M. K.)

Trailer Travel. The trailer coach industry, one of America's newest businesses, has established itself on a permanent basis. Ten years ago, the "house trailer," as it was then known, was an oddity. In 1939 while there are no definite figures available, it was estimated that there were more than 300,000 trailer coaches in the United States.

The Trailer Coach Manufacturers' Association, official organization of the principal manufacturers, has more than 35 members who either manufacture trailer coaches or are suppliers of parts. In addition, there are some 30 other trailer manufacturers and approximately 100 suppliers of trailer parts. The estimated production of trailer coaches during 1939 was 25,000.

Trailer parks have been and are being established throughout the 48 States. Florida has been the most forward-looking State in this regard, but her sister States are rapidly recognizing the importance of this addition to the tourist industry. (P. E.)

Transbay Bridge: see *BRIDGES.*

Trans-Jordan. Area 34,740 sq.mi.; pop. c. 312,000. Chief towns: Amman (cap.) c. 20,000; Es-Salt c. 10,000. Ruler: Emir H. H. Abdullah ibn Hussein, G.C.M.G., G.B.E.; high commissioner: Sir Harold MacMichael, K.C.M.G.; British resident: A. S. Kirkbride, O.B.E., M.C.; prime minister: Tawfiq Pasha Abdul Huda; language: Arabic; religion: Mobammedan (25,000 Christian Arabs).

History.—As a result of important reforms in its constitution, Trans-Jordan entered on a new phase of development during 1939. According to arrangements agreed to in principle by the British Government in May, the existing Executive Council was in August replaced by a Council of Ministers or Cabinet, each member of which is in charge of a department and is responsible directly to the Emir. Restrictions were also removed upon the Emir's power of raising and maintaining military forces, and there was a relaxation of the close control formerly exercised by the British Government over finance and administration. Such changes will, the British Government believes, "contribute effectively to the further progress of Trans-Jordan towards the goal of full independence."

The main objectives of present day Trans-Jordan are those of security, land development and the improvement of local standards of living. In furtherance of the first, a peace settlement was made in August of a long standing feud between the tribal heads of two sections of the Howeitat tribe which inhabits southern Trans-Jordan. In the same month the Trans-Jordan Frontier Force, which has been extremely successful in suppressing tribal raidings, seized a store of ammunition in the village of Arrabya, and a bandit headquarters was discovered and destroyed.

Land settlement is now progressing to keep pace with the rapidly increasing population.

Education.—In 1938-39: elementary Government schools 72; scholars 8,512.

Finance.—Revenue (1938-39) £P529,615; expenditure (1938-39) £P547,546; public debt (Dec. 31, 1938) £P31,009.

Trade and Communication.—Overseas trade 1937: imports, merchandise £P788,714, specie £P96,032; exports, merchandise £P472,399, specie £P112,950; re-exports £P92,545. Communications 1939: roads, Amman-Es-Salt highway completely asphalted and in good condition; railways, narrow gauge, 200 miles. Motor vehicles licensed: 103 private passenger cars; 185 public passenger cars; 15 buses; 231 commercial vehicles; 64 Government vehicles; total 598.

Agriculture.—Production (export) 1938 (in metric tons): fresh fruit 1,557 (£P15,656); wheat 32,619 (£P324,103); wool 33 (£P1,149).

Trap-shooting. Beginning with the doubles and distance championship of the New York Athletic club, at Travers Island, N.Y., in April, trap-shooters went through an active season in 1939. Tom Lawrence took the first title event, and Fred A. Cauchois captured the other from the 21-yd. line. At the annual clay bird championship shoot at the N.Y.A.C. the winner of the singles was Steve Crothers, 179x200.

The distance title went to John D. Rigg, off the 24-yd. line, with 97x100.

Walter Beaver covered himself with glory at the annual Clarence Marshall classic, at Yorklyn, Del., winning the "Marathon," "Brandywine," "Auburn Special" and the doubles title.

The Grand American, held under the auspices of the American Trap-shooting Association, the premier shoot in trapdom, was attended by 1,000 shooters, at the Vandalia, Ohio, traps. D. L. Ritchie won the G.A.H.; Walter Winteringham took the preliminary handicap; P. O. Harbage captured the clay target championship; Walter Peterson led in the champion of champions race; John D. Rigg shot his way to victory in the National doubles championship; Fred Tomlin excelled in the contest among professionals at 16 yards; John Peterson won the senior race; Rudy Etchen topped the juniors for title honours; the husband and wife title went to Mr. and Mrs. John K. Sanders; Joe Hiestand and Homer Clark, Jr., shot 594x600 at 16-yd. targets; Phil Miller scored 880x900 on all targets and Jack Lindsay made the longest run of the week, 353. Mrs. William Gilbert won the women's National title.

At the Jenkins Brothers' fall tournament, at Orleans, Ind., Joe Hiestand won the world's all-around championship at targets and flyers for the third time. The Westy Hogans staged their annual shoot at Asbury Park, N.J., in October, and to E. B. Springer went the trophy for breaking 100 straight targets. John von Gonsic captured the Cosmopolitan championship with 100 straight and the class B title; Lynn Hunt took the class A. The Hunters Special shoot at North Platte, Neb., brought out a new winner in Art Carmody, who captured the 50-target event after a shoot-off. The grand prize was won by Ralph Haws. (J. B. P.)

Truck Farming. Unlike the acreage of vegetables for fresh marketing, which increased in 1939 in the United States to a new high, the acreage of truck crops for processing, harvested in the United States in 1939, was only 1,105,000 ac., a decline of 21% from the acreage of 1938 and of about 29% from the record-high acreage of 1937. Production runs in an approximate ratio to acreage. Commercial truck crops follow a cyclical course, the United States Department of Agriculture points out, and adds that the lower acreage and production of 1939 are apparently the low point in the present cycle from the high of 1937. Usually carry-over stocks of processed vegetables increase for three years until the surplus becomes burdensome. Then planting and production decline for about two years until the supply is normal. At this stage acreage and production start on an increase. Most truck crops for processing are contracted before planting. Production of all such crops in the United States was 2,826,930 short tons in 1939 and 3,619,920 short tons in 1938, while the ten-year (1928-37) average was 3,282,660 short tons, the Department of Agriculture reports. The only crops showing an increase in 1939 over 1938 were asparagus, spinach and toma-

toes. Lima beans were only slightly reduced, but all others were sharply less. Prices received by producers in 1939 were about 8% under 1938 and about 16% less than in 1937. Production follows:

	1939 short tons	1938 short tons	1928-37 short tons
Asparagus	47,610	44,660	54,250
Beans (limas, shelled)	28,650	28,730	15,090
Beans (snap)	90,700	128,400	75,500
Beets	38,740	70,780	40,600
Cabbage (sauerkraut)	146,600	195,400	153,800
Corn (sweet, in the husk)	647,900	882,800	647,800
Cucumbers (pickles)	92,620	146,570	125,800
Peas (green, shelled)	193,950	302,540	193,660
Pimentos	23,190	38,840	15,110
Spinach	47,200	38,600	52,250
Tomatoes (q.v.)	1,925,500	1,742,600	1,458,600

Tuberculosis. Diagnosis.—*Tuberculin Test.*—The work of 1939 continued to emphasize the seriousness of tuberculous infection and the fact that 20% to 40% of apparently well, infected persons later fall ill. The post-mortem work of Feldman indicates that in many lesions of the first infection type, the bacilli completely disappear. Approximately 20% of the students of medicine and 24% of the students of nursing who entered Vanderbilt university as tuberculin reactors lost their sensitivity to tuberculin before graduation, which probably indicates that the tubercle bacilli in their bodies had died. On the other hand, Holló is of the opinion that those who become infected with very few exceptions remain infected all their lives. It is now known that a typical reaction to tuberculin nearly always indicates foci of living tubercle bacilli in the body. Therefore, the tuberculin test *continues to be the first screen in every age period of life*. A modification of one of the old methods of administering tuberculin, known as the patch test, was found by Weiner *et al.* of New York, and Court of England, to be slightly less satisfactory than the usual method of administration. Most workers are of the opinion that it will not become a substitute for the method of Mantoux.

X-Ray.—The X-ray examination of the lungs is the most effective method of locating macroscopic areas of disease. Several methods were employed during 1939.

(1) The usual slow X-ray equipment of offices and hospitals was most used. Both celluloid and paper films were employed with essentially the same results.

(2) The rapid method greatly increased in favour during 1939. The number of exposures possible per day is four or five times greater than by the slow method. When 500 or more examinations are made, the cost of the film delivered to the physician is 75 cents per person. The finished film is satisfactory in every respect.

(3) Roentgen-photography was used by Holm of Copenhagen, de Abreau of Brazil and others, who found it valuable and inexpensive.

(4) A new method consists of making a very small X-ray film of the chest, known as the microfilm. This must be projected on a screen for interpretation and there is still some question whether it will be adequate for detailed work.

(5) Stiehm devised a special fluoroscopic unit with which he has been able to detect areas of disease that were entirely missed by the usual X-ray film examination.

Laboratory Examination.—In the presence of silica, tubercle bacilli proliferate rapidly in the animal or human body. Pickoff injected silica suspension just beneath the skin in the flank of a guinea-pig and within the next two or three minutes he injected into the same area material suspected of containing tubercle bacilli, such as sputum in which germs could not be found by the direct microscopic examination; the bacilli when present multiplied so rapidly that in some cases within 10 to 15 days material aspirated from this area was found to contain tubercle bacilli in abundance. This method makes the diagnosis possible in approximately the same time as the method of introducing suspected

material into the body of a guinea-pig which does not react to tuberculin. Repeating the tuberculin test in 12 to 15 days usually results in a reaction if bacilli are present.

Surveys and Reports.—The eighth annual report of the Tuberculosis Committee of the American Student Health Association showed that among 37,000 students tested, 26% reacted to tuberculin. Progressive tuberculosis was discovered in 229 students.

Mencia *et al.* administered 27,000 tuberculin tests in Cuba and found 69.6% reacted. X-ray films by the rapid method of 10,949 reactors led to the finding of clinically manifest disease in 2.71%.

In Germany the sailors' union arranged for examinations of 18,000 sailors, following which sailors were no longer employed on German ships without certificates of examination. The German army is being examined by Roentgen-photography as a screen.

Treatment.—Drugs. Sulphanilamide, so valuable in certain diseases, such as gonorrhoea and streptococcus infection, has been found of little value in tuberculosis.

Fever Therapy in animals resulted in temporary improvement and prolongation of life. However, Krusen and Elkins recognize the grave danger of this method to patients and recommend that at present it remain in the hands of research workers.

Treatment of Young Adults Discouraging.—Zacks reported results of treatment of various forms in 532 young adults, mostly in the second decade of life, which are extremely discouraging. Among adolescents who had cavities in the lungs, even though treated, Simon found the disease proved fatal in approximately two-thirds.

Tuberculosis in General Hospitals.—Mikol and Plunkett examined 4,853 adult admissions, exclusive of those known to have tuberculosis in 14 general hospitals in 10 cities of upstate New York. Evidence of reinfection type of disease was found in 2.6%. The incorrigible, contagious case of tuberculosis is a serious menace to the health of the community. Harrington has begun to quarantine such cases in a general hospital and a sanatorium, as is done with other contagious diseases, such as diphtheria.

Tuberculosis in Physicians and Nurses.—Diehl has found that tuberculosis was responsible for one-fourth of all deaths among the graduates of the University of Minnesota medical school from 1919–36. He concluded that the hazard of tuberculous infection for medical students can be reduced by the application of modern control measures. A seven-year study of tuberculosis in nurses in the Cook County (Ill.) hospital led to an elaborate tuberculosis control program among the nurses. Observations on 757 students of medicine and nursing at Vanderbilt university where isolation technique was used showed that the number of students who became infected was much smaller than reported from most other institutions. Harrington *et al.* reduced by one-half the infection attack rate among students on a general hospital tuberculosis service by contagious disease technique similar to that employed in diphtheria. He believes that with improvement of technique the attack rate can be reduced to approximately that of the general public.

Immunity.—In an extensive review of the literature on immunology of tuberculosis, Lurie concluded that Calmette's vaccine (BCG) reduces definitely the tuberculosis mortality of exposed infants in the first year of life but that it can scarcely be expected to protect against marked reinfection during adult life.

Rehabilitation of tuberculous patients received much attention in 1939. Boards of health, departments of education, divisions of social welfare, State medical associations and others co-operated in the development of rehabilitation programs. Hochhauser presented the problem of the employment of ex-tuberculous patients in industry.

Mortality.—In the United States the mortality rate from tuberculosis in 1938 was 48.6 per 100,000; in 1928 it was 79, and in 1904 it was 202. In practically every nation reports show that mortality from tuberculosis is decreasing.

The program of controlling bovine tuberculosis throughout the nation by the United States Bureau of Animal Industry, in co-operation with the various States, continued to be most successful. Of the 3,072 counties in the nation, all but four have the modified accredited rating, which means that only .05% or less of the animals react to tuberculin. The remaining four counties will probably be accredited in early 1940.

The great value of controlling tuberculosis among the cattle herds of the U.S. has become more evident since Griffith and Thompson of England, Hedvall and others of Scandinavia, Huet of Holland, and workers in other European countries, have determined that so many cases of tuberculosis in human beings are caused by the cattle type. In nations where the disease has not been controlled among the cattle, as many as 25% of the cases of tuberculous meningitis, 20% of the cases of disease of the bones and joints, 50% of tuberculosis in the lymph nodes, and 3% to 6% of the cases of pulmonary tuberculosis have been found due to the cattle type of tubercle bacillus. Tuberculosis in swine and poultry continues to be a serious problem in the mid-western States, and the Bureau of Animal Industry, in co-operation with the various States, is making great strides in the solution of this problem. The dissemination of information concerning tuberculosis continued to be the major activity of the National Tuberculosis Association and its component organizations. In Nov. 1938 Potter concluded a series of eight splendid articles published in *Hygeia* under the title, "Tuberculosis Up to Date," which aided greatly in this program. (See also RADIOLOGY.)

Tungsten. The world's tungsten producing industry centres mostly in South-eastern Asia, whence came 56% of the 1938 total of 37,000 metric tons of concentrates (60% WO₃ basis), a small decrease from 1937; 36% of this total came from China, 9% from Burma, 3% from Malaya, and 8% from other adjacent territories, chiefly Chosen. Of production elsewhere, the United States supplied 7%, Bolivia 7% and Portugal 8%; other outputs are small and widely scattered.

Due to the disturbances incident to the Japanese invasion of China, the Chinese exports for 1938 dropped one-quarter below those of 1937. Shipments during the first half of 1939 were about 30% below the 1938 average; shipments were made through Hongkong and Indo-China, in about equal amounts; information is lacking as to developments later in the year. Exports from Burma and Bolivia during the same period were about at the 1937 level.

The United States industry is very erratic, and in spite of exceptionally heavy tariff protection is more or less at the mercy of world prices; production has been increasing consistently, however, since the depression low in 1932, reaching 3,180 metric tons in 1937. In addition to the domestic output the U.S. imported in 1937 about 5,300 metric tons of concentrates (60% basis), besides metal, alloys, compounds, etc., equivalent to 155 tons of concentrates. Imports were radically reduced in 1938, the equivalent total being only 185 tons of concentrates, but increased to 730 tons in the first 10 months of 1939.

The British Empire controlled 27% of the 1938 world output; 53% of the Empire total was in Burma, 17% in Malaya, 15% in Australia, 3% in Africa and 4% in Cornwall.

Germany is the largest consumer of tungsten, with 1938 imports of 15,400 metric tons (60% basis). War conditions may be expected to increase the demand for tungsten in appreciable amounts. (See also METALLURGY.) (G. A. Ro.)

Tunis: see FRENCH COLONIAL EMPIRE.

Tunnels. The year 1939 saw considerable activity and diversity of tunnelling conditions in rock and also in earth, with and without the assistance of compressed air in the workings as usual means of stabilization of "soft" ground, facilitating the skilled operations of miners in combatting earth forces. In this connection it is noted that in the early part of the year the U.S. Public Health Service and the U.S. Bureau of Mines instituted an experiment in the New York city Queens-Midtown Tunnel by which to minimize compressed air illness. During exit or decompression it provided the workers with masks connected to a supply of pure oxygen to breathe in place of the usual tunnel air. It appeared that by this means the nitrogen absorbed by the human body was more readily expelled and thus prevented formation of bubbles of nitrogen, the main source of compressed air illness. The practical conclusions on this experiment are not yet available.

A notable evolutionary feature in the design of shields for

WORKMAN testing section of vehicular tunnel under East river, New York city, to be completed in 1940

"soft" ground tunnelling during the past 40 years is simplification affording more direct attack on the tunnel faces to be mined. To this has been added time- and labour-saving devices for the handling of excavation and materials of plant and structure. The most recent and noticeable example of this was on the Queens-Midtown tunnel above mentioned. The "holing-through" of this Queens-Midtown Highway tunnel occurred on Nov. 8, 1939, thus terminating the driving of two tunnels of 31-ft. diameter through formations of rock and glacial materials with stretches of a combination of both. This hazardous work was carried out with efficiency and safety to the men engaged upon it. Each of the tunnels is about 4,000ft. long and the actual tunnel work thus far (Jan. 1, 1940) was done in 28 months; a very good record in the face of geological conditions.

The New York City Independent passenger transit system finished the two-tunnel part of its 6th avenue extension from 9th street to 13th street with the assistance of compressed air in "soft" ground and in the face of difficulties with interference of existing substructures.

The City of Chicago started work on its extensive passenger transit subway system. This system is being constructed in "soft" ground, a somewhat plastic clay, at moderate depth below street surfaces. The stations with island platforms are being constructed in part by a shield for each of the two track spaces and part of the intervening platform space mined by hand. The tunnelling from station to station is for a twin arched rectangular cross-section mined with the use of steel "liner" plates. All tunnel work is being performed under compressed air.

In London where most of the underground railway transit is at great depth below street surface one extension of 10mi. to the east and another of 6mi. to the north, in all 32mi. of tube tunnel, begun in 1937, was practically completed in 1939.

Work on the highway tunnel under the River Thames from Purfleet to Dartford about 20mi. downstream from London bridge has been stopped because of the war. A pilot tunnel and the shield chambers and two shields for the construction of the main tunnel were completed. The scheme provides for one main tunnel with provision for another parallel with it at 61-ft. centres. The external diameter of the tunnel is 30ft. 6in. There is a 20-ft. roadway between curbs. All the tunnelling operations require use of compressed air.

In the United States much rock tunnelling is in progress.

The San Jacinto tunnel, 13mi. long, part of the Colorado River aqueduct, which took over five years to excavate under serious difficulties in combatting great volumes of water, was completed in 1939.

All sections of the 85mi. of Delaware River aqueduct tunnels for the New York City Water Supply are under contract. Good progress was made on the older sections and most of the newer ones made good beginnings. The sinking of an auxiliary construction shaft to a previously driven drift was accomplished by boring a 3-ft. diameter Calyx drill hole followed by drilling and blasting to full size using the drill hole as a ready means of disposal without head gear, other items of plant and a minimum of labour. The ventilation provisions on these tunnels are commendably in keeping with progressive efforts to protect the health of the workmen.

It is reported a world's record was established for rock excavation when 1,534ft. of a drift of about 8ft. by 9ft. was driven in the month of October at the Carleton Drainage tunnel, Cripple Creek, Colorado, in granite requiring no support.

The largest program of traffic tunnels so far attempted was started in 1939 on the Pennsylvania turnpike, a super-highway of 160mi. over the Allegheny mountains, between Harrisburg and Pittsburgh. There are seven tunnels in the project, aggregating 6.7mi. long. Six of the seven bores are enlargements of the abandoned South Pennsylvania railroad tunnels; the seventh is on a new location. None of the old tunnels was completely holed through. This is high speed work, as the contract time is very short requiring the tunnels to be completed by May 1, 1940. The tunnels will have a clear inside width of 28½ft., 23ft. of which is roadway. The height from roadway to soffit of arched roof is 20 feet 6 inches. Walls are 18-in. minimum thickness. The roof is arched to 14ft. 3in. radius. Between the roadway ceiling and the arch is a ventilating air space, similar to that on Holland and Lincoln tunnels. A 4-ft. egg-shaped drain under the roadway is provided, with transverse drains to dispose of water. (J. FE.)

Turkestan, Chinese: see SIN KIANG.

Turkey, area (including Hatay) 296,500 sq.mi.; pop. (est. March 31, 1939) 17,829,000. Chief towns: Ankara (cap., 122,720); Istanbul (690,857); Izmir (170,959). President: General Ismet İnönü; language, Turkish; religion, Mohammedan.

History.—In spite of the loss of their great leader Kemâl Atatürk in 1938 and the anxiety caused by fears of Italian aggression in the eastern Mediterranean, the Turks faced 1939 with calm confidence. The Cabinet resigned on January 26, when Dr. Refik Saydam became prime minister. The invasion of Czecho-Slovakia by Germany alarmed the Turks by its revelation that the German "Drang nach Osten" had not been abandoned, and the Italian seizure of Albania confirmed them in their desire to seek a close understanding with France and Great Britain and led to immediate negotiations between the three Governments.

On May 12 the decision of the British and Turkish Governments to conclude "a definite long-term agreement of a reciprocal character in the interests of their national security" was announced. Its details remained to be negotiated, but both Governments declared meanwhile that in the event of an act of aggression leading to war in the Mediterranean area they would assist one another to the extent of their power. They also recognized that it was necessary to ensure the establishment of security in the Balkans.

In mid-June the negotiations between France and Turkey concerning the future of the Sanjak of Alexandretta (Hatay) were successfully concluded. On June 23 a Franco-Turkish pact resembling the Anglo-Turkish agreement was signed in Paris together with an agreement for the cession of the Sanjak to Turkey, which provoked bitter German and Italian criticism. The cession was formally made at Antioch on July 23.

During the next five weeks negotiations for the transformation of the preliminary agreements into an alliance gathered speed. The Russo-German pact surprised but did not shake the Turks, and on August 29 it was announced that the staff talks between the three Governments had resulted in a complete understanding. When war broke out Turkey strengthened her forces, watched Italy and endeavoured to promote a general Balkan understanding. Meanwhile the attitude of the U.S.S.R. towards Turkey had changed. After approving the Tripartite pact they now criticized it. After announcing the partition of Poland, M. Molotov invited the Turkish foreign minister to Moscow to discuss a Turco-Soviet pact of mutual assistance to ensure the security of the Black sea and the Balkans. On his arrival M. Sarajoglu was invited instead to sign new agreements involving the revision if not the abandonment of Turkey's engagements to Great Britain and France and a breach of the Straits (Montreux) Convention of 1936. He refused and after a month's negotiation the conversations were suspended. On October 19 an Anglo-French Treaty of mutual assistance with Turkey was signed at Ankara. Its main points were:—

Britain and France undertook to assist Turkey

- (a) if an act of aggression were committed against her by a European Power and
- (b) in the event of an act of aggression by a European Power leading to war in the Mediterranean in which Turkey became involved.

Turkey agreed to assist Britain and France

- (a) in the event of an act of aggression by a European Government leading to war in the Mediterranean in which these two Powers were involved, and
- (b) if these two Powers were engaged in hostilities in virtue of either of their guarantees to Greece and Rumania.

Another article provided for consultation between the three Powers in other cases of aggression. A protocol provided that the obligations of the Treaty could not compel Turkey to action having as its effect or involving as its consequence hostilities with the U.S.S.R. The duration of the Treaty was 15 years.

The Treaty produced wrath in Berlin, chagrin in Moscow and misgivings in Italy. In his survey of October 31, in which he admitted that the U.S.S.R. had urged Turkey to close the Bosphorus to the warships of non-Euxine Powers, M. Molotov accused Turkey of "entering the war orbit." Turkish diplomacy still worked for Balkan understanding but was opposed by Russia and Germany, and little helped by the Italian Government which, while adverse to Russian penetration of the Balkans, claimed almost a leadership in the Peninsula which no Balkan State would concede. After some tension caused by anti-Russian agitation in Bulgaria the relations between Ankara and Sofia became friendly and Turkey strove steadily for a Bulgaro-Rumanian understanding.

On December 27 an earthquake destroyed Erzincan and inflicted disastrous losses on the cities and villages of Eastern Anatolia. Over 25,000 persons were believed to have perished, and floods and blizzards caused further loss and suffering. (P. P. G.)

Education.—In 1938: elementary schools 6,700, scholars 764,691; secondary schools 140, scholars 74,107; lyceum schools 68, scholars 21,000; normal schools 16, scholars 2,807; professional schools 47, scholars 7,574; universities 2, number of students 9,588.

Banking and Finance.—Revenue, ordinary (est. 1939-40), £T.261,110,000; expenditure, ordinary (est. 1939-40) £T.261,064,192; public debt (Dec. 31, 1938) £T.533,613,687; notes in circulation (Aug. 31, 1939) £T.220,000,000; gold reserve (Aug. 31, 1939) £T.36,000,000; exchange rate (under Anglo-Turkish Agreement) 587 piastres (£T.1=100 piastres)=£1 sterling.

Trade and Communications.—Foreign trade, merchandise: imports (1938) £T.149,836,689; (Jan.-Aug. 1939) £T.94,040,000; exports (1938) £T.144,946,511; (Jan.-Aug. 1939) £T.76,767,000. Communications 1939: road, total, c. 24,500mi.; railways, State, 4,316mi.; private 269mi.; shipping, State lines, 57,908 net tons; motor vehicles licensed (Dec. 1937), cars and taxis 3,443, commercial 6,041, cycles 724; wireless receiving set licences (Apr. 1938) 33,753; telephone subscribers (1937) 19,481.

Agriculture, Minerals and Manufacture.—Production 1938, in metric tons: wheat, 4,270,262; barley, 2,404,702; maize, 603,867; rye, 452,621; oats, 263,436; coal, 2,588,957; cotton, ginned, 66,300; tobacco, 53,162; wool, 31,484; mohair, 7,618; silk, raw, 2,348; potatoes, 168,735; beet sugar, 46,000; rice, 47,645; olive oil, 33,759; sesamum, 25,835; chrome ore (export), 104,000; antimony ore (metal content) (1937), 659. Unemployment. The various nations in their reports to the International Labour Office, as of Dec. 1939, reported better employment in 1939 than in 1938. Throughout the world the picture improved particularly from the late spring of 1939 through the balance of the year. Preparations for war contributed appreciably to the acceleration of industrial activity both in Europe and in the countries which ship raw materials to Europe. The American business recession of 1937-38 did not affect the rest of the world seriously in 1938. The 21% decline in manufacturing employment in the United States between the summer of 1937 and that of 1938 produced no counterpart in any other nation.

The improvement during the first two-thirds of 1939, as compared with 1938, was not large. The later months of the year, after war broke out, produced more rapid advances in employment. Germany (including Austria), Japan, Great Britain, France, Denmark, Norway, Switzerland and Yugoslavia, particularly, felt the "war boom" by early summer.

The unemployment statistics of many nations are distinctly unsatisfactory and conclusions drawn from them are open to suspicion. The available figures are of two principal kinds, each gathered in several different ways; statistics of employment, *i.e.* of the number of people at work, and statistics of the number of people in need of work. Employment statistics are derived from "establishment" reports collected by mail or through field agents or labour inspectors. Unemployment statistics are furnished by the employment exchanges (applications for work), unemployment insurance systems (applications for benefits), unemployment relief records, reports of trade union secretaries and censuses of unemployment.

The various types of statistics agree reasonably well in their picture of what happened in the different countries but not always upon the extent of the changes which occurred.

Great Britain and Northern Ireland have three-fourths or more of their wage-earners (about 13,000,000) under unemployment insurance. Of these, 1,831,372 were wholly or temporarily out of work in Dec. 1938. In Jan. 1939 the number rose to 2,038,026 and then gradually declined to 1,430,638 by Oct. 1939. The summer and fall of 1939 saw unemployment at the lowest levels in Great Britain that it had been since 1929. The approach and reality of war was largely responsible for the low levels of unemployment. These figures are the numbers registered at the employment exchanges. The persons covered consist largely of insured unemployed required by law to be listed at the exchanges. If the 4,750,000 not covered by the insurance act were included in the figures, the unemployment percentage would be more apt to fall than to increase, since military service, the police, civil service, teaching and other relatively stable occupations are in this group.

Registrations of unemployed persons at the employment offices of the Irish Free State increased fivefold from the pre-depression years to 1935. Moderate declines in unemployment in 1936 were followed by a sharp decline in 1937. In 1938 the number of applicants began to increase and reached the highest levels since 1934 in Jan. 1939. From January through April approximately 105,000 were registered each month; thereafter the registrants decreased rapidly to approximately 70,000 in the summer.

Unemployment remained at high levels in France during the first half of 1939. It had reached its peak in 1935-36. The decline during 1937 was small. Conditions got worse in 1938. The year 1939 began with unemployment nearly as bad as in 1935. But by August a third of the unemployed were back to work. The employment exchanges had 460,816 registered in January and 333,150 in August.

The high unemployment figures which had obtained in the Netherlands since 1933 continued until March 1939. The winter of 1938-39 was very bad. From April improvement was rapid. There were 405,927 registered at the employment exchanges in January and less than 215,000 after April. The percentage drawing unemployment insurance benefits decreased from 31.3% to 19.5% from January to October.

Belgium experienced marked improvement in 1937 but with worse conditions in 1938. The average number unemployed increased from 125,929 in 1937 to 173,913 in 1938 and 221,468 in Jan. 1939. Unemployment continued at high levels in Belgium for the first eight months of 1939. The figure was 222,884 in September. In 1931, by contrast, it was 110,000. In 1937, the insured workers of Belgium lost 13.1% of their possible working

time; in 1938, 17.6%; in 1939 (eight months) 18.3%.

Denmark, Norway and Sweden all experienced moderate improvement during the first eight months of 1939 following slightly worse unemployment in 1938 than in 1937. Denmark's percentage of trade unionists unemployed was 21.4% for 1938. This percentage rose to 29.9% in Jan. 1939, then dropped to 11.1% by June. Norway's in 1938 was 22%, in Jan. 1939, 27.6% and July, 11.8%; Sweden's in 1938, 11.8% and in 1939, 9.3%. In the summer of 1939 the Swedish figures approximated pre-depression levels, averaging 6.5%, but in Denmark the summer average was 11.1% and Norway 13.5%. In the first half of 1938, there was little change in unemployment conditions in the Scandinavian countries.

The German census of 1933 recorded 32,300,000 people in the employable population, of whom 5,900,000 were unemployed. The average number of applicants at employment exchanges dropped from 912,312 in 1937 to 301,897 in Jan. 1939. It then fell rapidly to 93,933 in April and to 38,379 in July. The percentage of the insured population idle reached minimum figures in 1939. After January, when it was 1.5%, it dropped steadily .2% in June and was below 5% all summer. This is below what is ordinarily considered "zero employment."

Switzerland's employment exchange figures are unusually reliable measures of unemployment because both the relief act of 1919 and the unemployment insurance law require applicants to register at the employment exchanges. From 1927 to 1929, 2.2% of the employable population were wholly unemployed and 1.6% partially. For practical purposes, this is zero unemployment in any country. In 1929 an average of 8,131 applicants registered at the employment offices (out of about 2,000,000 employables). In Jan. 1939, the figure was 85,377. Month by month the registrations declined to a low of 25,275 in September. During the first eight months of 1939 the unemployment situation was approximately the same as in 1931 and the best it had been since 1931.

The Italian index of employment (1929=100) was down to 78.5 in 1932 and back to 94.9 in 1936, 104.5 in 1937 and 110.7 in 1938. The index for 1939 continued to move upward as a result of European wars. Taking into account the growth of population, these figures indicate employment in the reporting establishments approximating the 1929 level in the early summer of 1937. Statistics for Italy during 1938 were not available.

Czecho-Slovakia and Yugoslavia both had a rapid improvement in employment in 1937 followed by slight additional improvement in 1938. The Czecho-Slovak figures for late 1938 and 1939 were disturbed sufficiently by the seizure of the country by Germany so that they are non-comparable with the earlier figures. But they show marked reductions in unemployment.

Yugoslavian employment exchange statistics record an average of 22,517 registrants for work in 1938. The number exceeded 30,000 during the winter of 1938-39, then moved gradually downward to approximately 17,000 in the summer of 1939.

The only Mexican figures on unemployment are "official estimates." The figure given for 1930 was 75,695; 1932, 339,378; 1938, 204,702; and the first four months of 1939, 210,659.

The general trend of employment in the United States and Canada was downward in the first half of 1938, with severe unemployment, particularly in the United States, until the spring of 1939. There was then steady improvement the balance of the year.

The Canadian employment index (1929=100) averaged 97.7 for 1937 and 94.8 for 1938. The index was at 90.5 in Jan. 1939 and rose to 98.5 in August. It rose sharply during the last third of the year but the exact figures were not available. The employment exchanges carried average registrations of 105,236 the first seven months of 1939. Estimated unemployment dropped from 485,000, Jan. 1939, to 352,000, Aug. 1939.

1939	83.7	86.0	87.6	85.5	85.0	86.5	84.4	89.8

The United States took a special census of unemployment, Nov. 20, 1937, which recorded 7,822,912 as unemployed (2,001,877 of whom were employed on Government relief work). This census was a voluntary report of individual citizens on forms left at all homes by the postal service. Sample tests made on 1,455 mail routes indicated that a 100% return might have shown as many as 10,800,000 idle on November 20. A half-million workers were laid off in Nov.-Dec. 1937. Comparing these figures with the 13,500,000 to 14,500,000 idle in 1932-33, the 1937 unemployment figure was discouragingly large. Minimum unemployment for the United States would be 1,500,000 to 2,000,000.

Previous to 1930 the American economic system expanded each decade rapidly enough to absorb the growth of population. During the '30s economic growth failed to keep pace with the growth of labour supply. The unemployment of 1937 was in considerable measure due to this factor.

The factory employment index of the U.S. stood in the census month (Nov. 1937) at 104.1 (1923-25 base). A year later it was 93.3 and from Jan. to Aug. 1939 ranged between 92.2 and 96.4. It rose during the later months of the year but the exact figures were not available. The low point for the '30s was in 1932 when it fell to 66.3.

Payrolls always fluctuate more violently than employment because of over-time and part-time work. The monthly average of payrolls (1923-25=100) was 110.4 in 1929; but 46.7 in 1932; 85.6 in 1936; 102.0 in 1937; 77.9 in 1938 and 86.6 during the first seven months of 1939.

There were employed on public work financed by other than "regular" appropriations in the United States, approximately 3,423,000 people in June 1938. This was the highest monthly figure for work relief down to the end of 1939. There were 2,671,462 in Sept. 1939. Further substantial decreases occurred during 1939.

While employment exchange statistics are available for the U.S. the figures have been so profoundly influenced by relief, public works and other governmental policies that they cannot be used without careful explanation of their gyrations.

Japan was one of the nations with high employment in 1937, a by-product, of course, of war. Their employment index (1929=100) was 128.8 in 1937, and 141.8 in 1938. In 1939 it rose to 158.0 in June. The Government's official estimates of unemployment in 1932 estimate that but 6.8% of their employable population was idle, a figure hard to reconcile with an employment index of 82 that year. For Jan. 1939, their unemployment estimate was 212,254. The estimates were about 60,000 lower during 1939 than for the corresponding months of 1937. Japanese unemployment was low, 1937-39.

New Zealand's are entirely employment exchange figures. They indicate a gradual improvement in employment after 1934,

with 1937-38 distinctly better than any year since 1933. The numbers registered ranged between 1,000 and 9,000, Jan. to Aug. 1939. These are extremely low figures, corresponding to those of 1928-30.

The only unemployment figures for Australia are compiled from reports sent in by union secretaries—a not very satisfactory type of unemployment statistics. The Australian trade union returns show 31,000 or 7% of the union workers unemployed (monthly average) in

1927; a figure which grew steadily to 120,454 (29%) in 1932 and then gradually subsided to 53,992 (12.2%) in 1936. The figures averaged 41,823 in 1937 and 40,526 in 1938. In 1939, there was an increase to above 46,000 in the first half of the year.

The employment exchange registrations in Chile jumped from an average of 29,345 in 1931 to 107,295 in 1932, and then gradually dropped to 30,055 in 1934. Since then, applications for work have been at low levels. Registrations averaged only 10,672 per month in 1935, 6,474 in 1936, 3,215 in 1937 and 4,578 in 1938. During the first seven months of 1939 they ranged from 8,000 to 10,250. (See also SOCIAL SECURITY; UNITED STATES; WAGES AND HOURS.)

Unemployment Relief: see RELIEF.

Unfederated Malay States, area 24,728 sq.mi., population (1931) 1,600,895, is one of the three main sub-divisions of British Malaya (see articles, STRAITS SETTLEMENTS and FEDERATED MALAY STATES). They consist of six States, of which five, Johore, Kedah, Perlis, Kelantan, and Trengganu, are located on the mainland of the Malay peninsula, while the sixth, Brunei, is on the island of Borneo. They are ruled by native sultans who have entered into treaty relations with the British Crown under which British advisers are appointed to the rulers. A number of British officials are employed in the service of the various States. Johore and Kedah are the most developed of the Unfederated States. There are Japanese iron concessions in Johore, which is on the mainland, opposite Singapore, and in Trengganu. Estimates of the population of the five land Unfederated Malay States in 1937 were as follows: Johore, 613,510; Kedah, 474,775; Perlis, 52,703; Kelantan, 400,378; Trengganu, 198,246. (W. H. CH.)

Union of Soviet Socialist Republics.

Area (exc. Western Ukraine and Western White Russia): 8,167,599 sq. mi.; pop. in 1939: 170,467,186; including Western Ukraine and Western White Russia, 185,809,012. In 1926, Russians were about 53% of the population; Ukrainians, 21.2%; White Russians, 3.2%; Kazakhs, 2.7%; Uzbeks, 2.6%; Tatars, 1.9%; Jews, 1.7%; Georgians, 1.2%. The social composition in 1937 was: workers and employees, 34.7%; collectivized peasants and co-operative craftsmen, 55.5%; individual peasants (other than Kulaks) and crafts-

men, 5.6%; other sections of population (students, army, pensioners, etc.), 4.2%. In language, the population of the U.S.S.R. belongs to the following groups: Indo-European, Caucasian, Semitic, Finno-Ugrian, Samoyede, Turkish, Mongol, Tungu, Palaeo-Asiatic and the Far Eastern civilized languages (Chinese, Japanese, etc.). 141 languages are spoken in the U.S.S.R. Cities of over 500,000 (1939) are: Moscow, 4,137,018; Leningrad, 3,191,304; Kiev, 846,293; Kharkov, 833,432; Baku, 809,347; Gorki, 644,116; Odessa, 604,223; Tashkent, 585,005; Tiflis, 519,175; Rostov-on-Don, 510,253; Dnepropetrovsk, 500,662.

History.—On Jan. 30, 1939, there was published the outline of a third Five-Year Plan, covering the years 1938-42, the chief aim of which was to achieve self-sufficiency in the basic heavy industries and the production of munitions. The plan calls for a yearly increase of 13.5% in industrial production, for the creation of coal and oil reserves and for the doubling of electrical energy. M. Molotov, speaking to the 18th congress of the Communist Party on March 16, foretold the necessity for two or three further Five-Year Plans, and expressed the opinion that by the end of 1942 the volume of industry would be increased by 88% and that the oil fields between the Volga and the Urals—"the second Baku"—would be producing 7,000,000 tons of oil per annum.

By terms of a new labour code, which came into force on January 15, each worker was provided with a "labour card" showing particulars of his employment and the reasons for any change of or dismissal from employment, etc., and without which no one could be employed at one place for more than five days; further, a month's warning had to be given by any worker wishing to change his place of employment. On May 28 measures were announced "to protect the common land of the collective farms from waste": limiting the amount of land permitted to collective

farmers for their own use, and raising the minimum number of days for work on the collective farms; and providing for the size of each collective farm to be determined.

Regulations were made governing the payment of machine tractor stations for their services to the collective farms; and decrees were issued on surveying the land in individual holdings.

The Far East.—In January Russia and Japan mutually accused each other of violating the spirit of the Portsmouth Treaty (1905), as a result of the Soviet Government's declared intention of letting the Far Eastern fishing grounds by tender or auction on March 15. Japan objected that Russia was making a political problem of the fishery question, and Russia replied that, in view of Japan's general policy toward her, she had to take precautions to guard her frontiers. In February it was stated that, if negotiations failed, Japan would take steps to maintain her rights. An agreement was signed on April 2 whereby the existing fisheries agreement of 1928 was extended until December: Japan paying 10% higher rental for 27 less fishing sections than she had in 1938, and Russia reserving 37 sections for strategic reasons.

During June and July the question of Japan's conduct of her oil and coal concessions in Northern Sakhalin caused some dispute. A Japanese protest against the imposition of a 374,000-rouble fine on a Japanese coal mining company was rejected by the Soviet Government, who contended that Russian employees were neither housed nor working under the conditions agreed upon in 1922 between the two Governments. On August 12 an agreement was reached whereby the Soviet employees of the Japanese-owned Northern Sakhalin Petroleum Co. should receive a 15% wage increase and the company might import 480 Japanese workers.

There was a continuance of border clashes between Soviet and Outer Mongolian troops and aircraft on the one hand, and Japanese-Manchoukuo forces on the other. Early in 1939 there were mutual recriminations regarding a Japanese landing on an island in the Argun river, and a reported crossing of the Manchoukuo frontier by Russian troops; and there was some local fighting. There was also intermittent air fighting from May onward from out of Outer Mongolia and Manchoukuo, accompanied by some infantry fighting, the most serious being occasioned by the reported crossing of the Outer Mongolian frontier south-east of Lake Buir by Japanese and Manchoukuo troops in July. On September 16 an armistice was signed in Moscow providing for the immediate cessation of hostilities and for the setting up of a mixed commission to demarcate the frontier; and on November 20 it was announced that an agreement had been reached by this commission.

Central and Northern Europe.—During 1939, the Soviet Union was wooed simultaneously by Germany and the Western democracies, and her final choice came as a surprise to practically the whole world. On February 2 Russia severed her diplomatic relations with Hungary, owing to that country's adherence to the anti-Comintern pact; and this certainly did not presage any amelioration of her relations with Germany. M. Stalin's speech to the congress of the Communist Party in March indicated fear of the "aggressive States" (chief among which he placed Germany) and distrust of the policy and intentions of the "non-aggressive States" (Great Britain, France and the U.S.A.); the latter, he said, had encouraged the aggressor by repudiating the policy of collective security, allowing Germany a free hand in central Europe and so pushing her further eastward. The note handed by M. Litvinov to the German ambassador on March 19, after the annexation of Czecho-Slovakia, was uncompromising in its condemnation of that action; and at about the same date the Soviet Government, in reply to a British enquiry concerning the Russian attitude in the event of an unprovoked attack on Rumania, proposed an international conference to consider the question of German aggression—a proposal rejected by the British Government as being pre-

*Including the occupied Western Ukraine.

†Including the occupied White Russia.

mature.

The news, announced on May 3, that M. Litvinov had been released from the office of foreign commissar, which he had occupied since 1930, and that he had been succeeded, not by the assistant commissar, M. Potemkin, but by M. Molotov himself, gave rise to much speculation abroad as to the future course of Russia's European policy.

In a speech by M. Molotov to the Supreme Council on May 31, it became, however, increasingly evident that Soviet policy hinged on the specific question of guarantees to be given to the three countries on her north-west frontier, namely, Finland, Estonia and Latvia. The Russian demands were amplified in a reply on June 2 to further British and French proposals received on May 27, and five days later *Pravda* published the four minimum conditions required by them for a defensive organization, namely, (1) Conclusion of an agreement by the three countries for effective mutual assistance against aggression; (2) An agreement for the U.S.S.R. to give assistance to States guaranteed by Britain and France particularly Belgium, Greece, Rumania, Turkey and Poland in case they were attacked; (3) A guarantee by the three countries to assist the three Baltic States should their neutrality be violated; (4) A concrete agreement about the methods, the form and the extent of help to be given. The importance of the guarantee for the Baltic States was again urgently stressed on the grounds that an attack by Germany through these countries would be more dangerous than an attack through Poland and Rumania, which were already guaranteed by Great Britain and France. The difficulty lay in the fact that the Baltic States themselves had refused such a guarantee, which they felt would compromise the strict neutrality they desired, and both Britain and France declared it to be manifestly impossible to impose a guarantee on States not desiring it.

In the meantime it had been arranged that a British and French military mission should visit Moscow and it was proposed, concurrently with military conversations, to hold political discussions with a view to reaching a final conclusion. The mission arrived three days after Mr. Strang had left and staff talks began on August 12, and were resumed, after a break of three days, on August 21 (the day on which Herr von Ribbentrop announced the conclusion of the Russo-German pact), but still no satisfactory conclusion was reached. On August 27 Marshal Voroshilov presented the Soviet explanation of the failure. To give effective aid to Poland, Soviet troops would have to enter Polish territory, but the Anglo-French mission did not agree with this, and the Polish Government refused to accept assistance from the U.S.S.R. That, he declared, made military co-operation between Russia and the Powers impossible. Shortly afterward the Allied military missions returned to England.

The Russo-German pact of non-aggression was signed in Moscow on August 24 and ratified by the Supreme Council on August 31. (See also COMMUNISM; FRANCE; GREAT BRITAIN.)

The terms of the pact were briefly as follows: the two countries agreed not to attack each other, either independently or in conjunction with other powers; not to support any third power which might attack the other party to the pact; to remain in consultation with each other upon questions touching their common interests; not to join any group of powers directly or indirectly threatening one of the two parties; to solve all differences between the two by negotiation or arbitration. The pact was to last for ten years, with automatic extension for another five years unless either party gives notice to terminate it one year before its expiration.

Among the multitudinous and far-reaching effects of the pact with Germany the most immediately important, from Russia's point of view, were the removal of the fear of German penetration into the Ukraine, and the absorption into the Soviet Union (whether or not in accordance with a prearranged agreement with Germany) of a great portion of Poland. The Soviet view was that Russia could not remain inactive in face of the rapid collapse of Poland before the overwhelming German invasion; and that since there was now no question of helping Poland against Germany, Russia's only course in her own interests was to march into Poland from the east, and by so doing set a limit to Germany's eastward expansion while extending her own influence westward into Europe. On September 16 M. Molotov handed the Polish ambassador a note to the effect that Soviet troops were about to enter Polish territory—a note which the ambassador refused to accept, although he informed his Government of its contents. On the following day Russian troops entered Poland, and M. Molotov broadcast to the nation the reasons claimed for this action. The Polish State and its Government, he said, had virtually ceased to exist, and consequently all treaties between the Soviet Union and that country were void. The Soviet Government could not remain indifferent to the fate of its blood brothers, the Ukrainians and White Russians inhabiting Poland, and the Red army had crossed the frontier to take under its protection the lives and property of the populations of Western Ukraine and Western White Russia, and to deliver the Polish people from the war into which their unwise leaders had plunged them.

As a result of the treaty signed with Germany on September 29 for the partition of Poland, Russia acquired the provinces of Vilna

NEW FRIENDS OF 1939: German Foreign Minister von Ribbentrop, Joseph Stalin, and Premier-Foreign Minister Molotov of Russia just after the signature of the Nazi-Soviet pact of non-aggression early in the morning of Aug. 24, 1939, at Moscow

(but on October 10 the city and district of Vilna were ceded to Lithuania), Nowogrodek, Polesia, Volhynia, Tarnopol and Stanislawow, nearly the whole of the province of Bialystok and the eastern part of the province of Lwow—very roughly, that is, five-eighths of the area and half the population of Poland. (See also EUROPEAN WAR; POLAND.)

Neither Russia's pact with Germany nor her occupation of Poland modified the Soviet Government's assertion of technical neutrality in the European war between Germany and the Western democracies; although, after the conclusion of the treaty of friendship on September 29, Russia and Germany jointly declared that they would consider Great Britain and France responsible for any continuation of the war, for which there no longer existed any reason, and that they would consult together regarding the measures to be taken if the war were continued. Against this, however, it may be recorded that, in its manifesto issued on the occasion of the anniversary of the Revolution on November 6, the Comintern accused Germany, equally with Great Britain and France, of conducting a war for world domination. The German-Soviet treaty of friendship finally demarcated the Russo-German boundary in Poland; and it provided for the drawing up of an economic program according to which the Soviet Union would furnish raw materials to Germany which would be counterbalanced by Germany by means of deliveries of industrial products to be made in the course of a longer period. With the Polish question settled, the Soviet Government was free to devote its attention to a matter which for long had been the object of its earnest consideration, namely, its relations with the three Baltic States and Finland.

Frontier incidents were alleged by Soviet Russia, culminating in the action of Finnish artillery, reported by Moscow on November 26 but denied by Finland, and causing casualties among the Soviet troops in the Karelian isthmus. M. Molotov thereupon handed the Finnish ambassador a note demanding the withdrawal of Finnish troops 12 to 15 miles from the frontier. On November 28 the Soviet Government denounced the treaty of non-aggression with Finland which had been signed in 1932, on the ground that the concentration of Finnish troops in the neighbourhood of Leningrad was inconsistent with the treaty. Relations between the Soviet Union and Finland were broken off on November 29, and on the 30th Russian troops invaded Finland. (See also ESTONIA; EURO-

PEAN WAR: *Russian Campaign in Finland*; FINLAND; LATVIA; LEAGUE OF NATIONS; LITHUANIA.)

Turkey and the Balkans.—From April 29 to May 5 M. Potemkin, assistant commissar of foreign affairs, was in Turkey on a special mission, as a result of which it was announced in Turkey that the Turkish and Soviet Governments would "pursue their parallel efforts for safeguarding peace and security and would continue to keep in constant touch in order to exchange political information bearing upon their common interests." From September 25 to October 17 the Turkish foreign minister, M. Sarajoglu, held intermittent conversations in Moscow with MM. Stalin and Molotov in an effort to examine and define these "common interests," but the Soviet Government could not persuade Turkey that the proposed Russo-Turkey treaty was reconcilable with the Anglo-French-Turkish pact, and the negotiations were abortive. On November 14 the Soviet press, which had welcomed the Anglo-Turkish pact on its first announcement in May, accused Great Britain and France of using the pact as a means for exerting pressure upon the Balkans. On his way back from Turkey in May M. Potemkin also visited Sofia and Bucharest; and on May 8 it was reported from Bucharest that the Soviet Government had made offers of defensive guarantees to the small Eastern European States. On September 17, the day on which Soviet troops entered Poland, the Government gave Rumania an assurance that Russia would respect her neutrality. (X.)

Cultural Life.—Pupils (elementary and secondary schools) (1938-39), 31,517,400; higher educational institutions (1938-39), 709; students, 602,900; libraries (1938), c. 70,000, with 126,600,000 books; teachers (1937), 969,000; agriculturists (1937), c. 80,000; newspapers (1937), 8,521, in 36,200,000 copies; printed books (1937), 673,500,000 copies.

Banking and Finance.—National income (1938) at 1926-27 prices, 105 milliard roubles; capital investments in national economy (1935-37), 155.4 million million roubles. Revenue (1938), 156,097,829,000 roubles; expenditure (1938), 155,447,829,000 roubles. State bank (1938): 3,300 branch banks and agencies with about 100,000 employees; granted credit to industry (1938) of 475,000,000,000 roubles; total turn-over of the bank (1938), 2,743,000,000,000 roubles.

Trade and Industry.—Gross retail trade turn-over (1938) at 1926-27 prices: 138,574.3 million roubles. Foreign trade (Jan.-Dec. 1938): total export, 1,831,927,000 roubles; total import, 1,422,882,000 roubles. Main exports to Great Britain, 375,124,000 roubles; to Belgium-Luxemburg, 116,803,000 roubles; to U.S.A., 96,749,000 roubles. Main imports from U.S.A., 405,858,000 roubles; from Great Britain, 240,309,000 roubles; from Holland, 102,535,000 roubles.

American-Soviet trade (1938): exports to the U.S.S.R., \$69,691,000, mainly machinery exports valued at \$35,050,000; imports from U.S.S.R., \$23,532,000, mainly furs \$12,127,000, manganese ore \$2,662,000, anthracite \$1,125,000. Anglo-Soviet trade (1938): exports to the U.S.S.R., £6,433,573 (Jan.-May 1939, £2,954,234). mainly machinery £3,353,000, non-ferrous metals £1,329,000. woollen rags £390,000, iron and steel £326,000, vehicles £122,000; imports from the U.S.S.R., £19,543,030 (Jan.-May 1939, £2,932,110), mainly wood and timber £6,316,000, grain £4,187,000, furs £3,630,000, petroleum £1,415,000, canned salmon £1,183,000; re-exports to the U.S.S.R., £10,985,945 (Jan.-May 1939, £2,129,018), mainly non-ferrous metals £7,783,000, rubber £1,056,000, wool £995,000, tea £553,000.

Industry (1938): output of coal, 132.9 million tons; iron ore, 26.5 million tons; pig iron, 14.7 million tons; steel, 18 million tons; manganese ore, 2,272.8 thousand tons; oil, 32.2 million tons;

peat 26.5 million tons; electric power, 39.6 milliard kwh.; whole industrial production (at prices 1926-27), 106.1 milliard roubles.

Transport.—(1938) Length of railways 85,000km. (1,000km. electrified); passengers carried, 1,177.8 million; goods, 516.7 million tons; length of inland waterways, 90,600km.; passengers carried, 68.1 million; goods (1937), 66.9 million tons; freight carried by sea, 30.4 million tons; passengers, 3.1 million; length of air lines (1939), 116,000km.; passengers carried, 292,700; freight, 45,500 tons; mail, 10,700 tons.

Agriculture.—In 1938: collective farms, 242,000, embracing 18,842,900 peasant homesteads; State farms, 3,961; individual peasant homesteads, 1,309,900; machine tractor stations (1939), 6,358; tractors, 483,500; total sown area, 136,900,000ha., including grains 102,400,000ha., industrial plants 11,000,000ha., vegetables, 9,400,000ha., feed-grasses 14,100,000 hectares. Sown area of collective farms, 117,200,000ha.; State farms, 12,411,000 hectares. Yield of grain crops, 854,900,000 quintals; fibre flax, 5,460,000 quintals; raw cotton, 26,900,000 quintals; sugar beet, 166,800,000 quintals; potatoes, 419,600,000 quintals. Agricultural production (1937) at 1926-27 prices, 15,069.5 million roubles; livestock production (1937) at 1926-27 prices, 5,053.5 million roubles. Horn cattle, 63,200,000; pigs, 30,600,000; sheep and goats, 102,500,000; horses, 17,500,000. (See also FASCISM; JAPAN; PROPAGANDA; RELIGION; UNITED STATES: *Roosevelt and the Dictators*.) (S. YAK.)

Unitarian Church. Chief among the activities of the American Unitarian church during the year 1939 was the relief mission sent to Czecho-Slovakia in co-operation with the American Friends Service Committee, to administer the funds raised by the American Committee for Relief in Czecho-Slovakia. The Rev. and Mrs. Waitstill H. Sharp of Wellesley Hills, Massachusetts, were sent early in February and remained until September. The Rev. Duncan Howlett of New Bedford, Massachusetts was also sent to make a survey of Czech refugee needs in Poland. The outbreak of the war made impossible any immediate work in that area—but the commission reorganized itself to be prepared to raise additional funds and supply personnel for European relief missions as soon as opportunities were opened.

Because of the outbreak of the war in Europe, plans for the next International Association Congress to be held in Budapest, Hungary were cancelled.

The biennial conference of the American Unitarian Association was held in San Francisco, Aug. 24-27, 1939. The principal speakers were the Hon. Sanford Bates, moderator of the American Unitarian Association, and Dr. Alice Garrigue Masaryk, daughter of the founder-president of Czechoslovakia.

Under the extension program, two new churches—in Fort Wayne, Ind. and in Grosse Pointe, Mich.—were organized, and three others were admitted to the association. The regional organization of the association was strengthened by the development of the Southern New England Council of Unitarian Churches and by a former vice-president of the association assuming the directorship of the South-Western area with headquarters in Tulsa, Oklahoma.

Under the direction of a newly organized Department of Promotion and Publicity, a national radio program was instituted originating over a Boston station and released by electrical transcription in the South, Mid-West and Pacific Coast. The same program was also released on a weekly world-wide short wave broadcast. The year 1939 marked the 400th anniversary of the birth in Siena, Italy of Faustus Socinus, leader of the Unitarians in the Reformation period, whose influence spread throughout Europe, especially in Poland.

There was peculiar significance to the celebration of this anniversary in the churches. (J. H. L.)

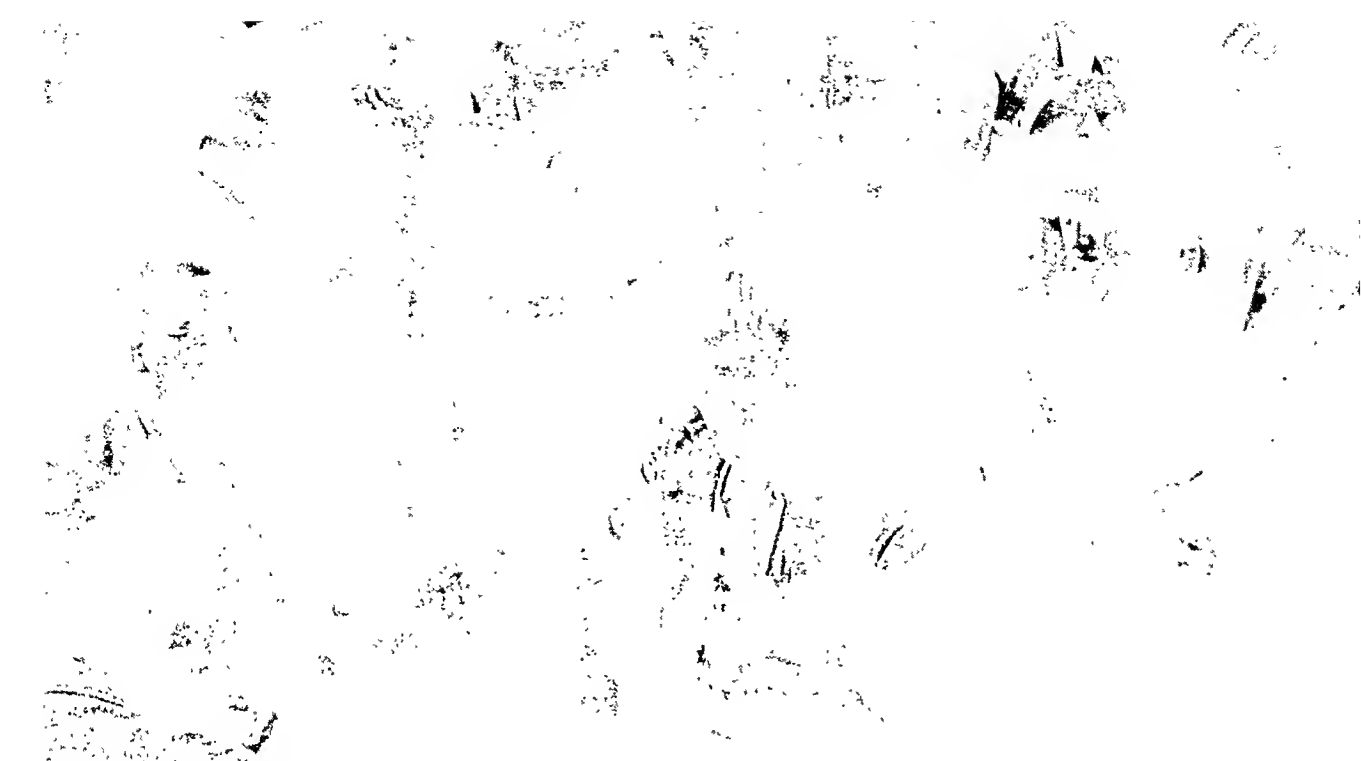

United Kingdom: see GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.

United States. The United States Bureau of the Census estimated the number of inhabitants on July 1, 1938, at 130,215,000 (later estimates were discontinued until after the 1940 census). This marked an increase of 958,000 over July 1, 1937, and of 7,440,000 over the 1930 census. Population figures for individual States may be found in the separate State articles. See also the articles BIRTH STATISTICS; CHURCH MEMBERSHIP; DEATH STATISTICS; EDUCATION; ILLITERACY; INDIANS, AMERICAN; NEGROES (AMERICAN); POPULATION, MOVEMENTS OF and UNIVERSITIES AND COLLEGES for statistical information of social conditions. (X.)

History.—While domestic problems like relief, labour, housing, agriculture, party politics and the third term issue continued to occupy attention during the year 1939, they were overshadowed to an extent not equalled since the days of the World War (1914-18) by the precarious state of European peace. The "appeasement" policy at Munich, in Sept. 1938, after Hitler had absorbed Austria, did not deter him from forcibly annexing the Sudetenland and reducing Czechoslovakia to a virtually vassal State. As the year 1939 progressed his demands on Poland to yield Danzig and the Corridor culminated in September in a ruthless invasion of Poland (after an astonishing alliance between Nazi Germany and Communist Russia) and the rapid extermination of that unhappy State, now partitioned, for the fourth time, between its powerful neighbours. The Polish invasion brought Great Britain and France into the lists against Germany, thus starting the European war. The closing weeks of the year saw Russia, taking a leaf from Hitler's book of aggression and roused by the Polish booty to dreams of westward expansion, demanding by arms the virtual reduction of Finland to puppet state and threatening the security of Finland's neighbours, Sweden and Norway, across the Baltic. Faced thus with actual war in Europe and with the uncertainty as to whether this war would eventually draw the United States into its orbit, as the war of 1914-18 had done, the U.S. Government and people quite naturally grew more and more interested in the political, diplomatic and commercial policies which should conduce to the preservation of neutrality and at the same time not isolate the U.S. in sympathy from the European nations that were fighting against the wanton aggressions and international bad faith of the totalitarian despots.

QUEEN ELIZABETH and Mrs. Roosevelt took a short sight-seeing tour June 8, 1939, during the British monarch's visit to Washington

BY A PORTABLE RADIO installed on the steps of the U.S. Capitol, these Americans, like millions of others, listened to Pres. Roosevelt's speech Sept. 21, 1939, in which he urged Congress to revise the U.S. Neutrality Act.

Business conditions improved during the year 1939, but not so rapidly as had been predicted at the opening of the year. Autumn saw an approach to the high levels of 1936. Steel production was up 20% to nearly capacity. Electric power production was at its height. Chain stores registered increasing business. Automobile manufacturers were planning the biggest year since 1933. The Federal Reserve Board's official index of Dec. 9, 1939, showed an industrial production figure of 125 as contrasted with 119 in 1929, based on the averages of 1923-25. The increase of 5% in the month of November alone doubtless represented the anticipation of a great boom in war orders (especially aeroplanes) which may or may not materialize. At any rate, the scarcity of new legislation for the regulation of business and the relative moderation of the administration in exercising the control which certain elements of big business have called persecution have encouraged private industry to grapple more confidently with the problems which have retarded the economic recovery which the vast resources in man power and materials ought to guarantee.

Congress.—The first session of the 76th Congress, which convened on Jan. 3, 1939, showed the decided gains which the Republicans had made in the mid-term elections of the previous November. The Democratic representation in the House was reduced from 346 seats in the 75th Congress to 262, while the Republicans increased from 89 to 169. In the Senate a gain of seven seats raised the Republican representation from 16 to 23. Though the Democrats still had very large majorities in both houses, dissatisfaction in their ranks with some of the major policies of the administration (such as relief, the continually growing deficits, certain clauses in the Social Security Act and the Wages and Hours Act, and the administration of the National Labor Relations Board) enabled a combination of these dissatisfied elements with the Republicans to stymie the President's plans. In none of the previous Congresses of the Roosevelt administration had there been shown so strong a spirit of independence of the will of the President, so ready a disposition even among his own fol-

lowers to criticize or amend the laws which they had passed so readily at his bidding. The session lasted from January 3 to August 5, and its debates fill 12,000 pages of the *Congressional Record*. But, unlike the previous sessions, it passed no new major laws. Indeed, the President said in his opening address that the program of the New Deal was virtually completed: "We have moved upon deep-seated problems affecting our national strength and have forged national instruments adequate to meet them." He confessed that some of these instruments had to be roughly shaped and needed machining down. He had no objection to this process, provided that the "basic principles of the New Deal" were retained. But the "machining down" often bit pretty deeply into the metal. For example, a spending-lending (nicknamed "splending") bill advocated by the President as an aid to business was ruthlessly thrown out by the House, as was a bill permitting the United States Housing Authority to loan \$800,000,000 to States and cities for slum clearance and the construction of low-cost dwellings. The President asked for \$875,000,000 to continue the relief work of the WPA until the end of the fiscal year (June 30, 1939), but Congress cut the figure down by \$50,000,000. His request for \$1,755,000,000 for the same work for the year 1939-40 was granted, but Congress accompanied the grant with provisions designed to prevent relief from becoming a "career." WPA workers might not remain on the rolls for more than 18 consecutive months, and a minimum of 130 work hours a month was prescribed. Relief to certain classes of "white-collar" workers was cut down. The Hatch Act, passed in July, aimed at taking politics out of relief by making it unlawful, under a penalty of \$1,000 fine or a year's imprisonment, for anyone to solicit from persons on relief "any assessment, subscription, or contribution for any political purpose." Such changes as were made in the revenue laws were favourable to business. No increase was made in the income tax rates, while the capital gains tax was reduced and the surplus profits tax eliminated. The President's persistent plea for the repeal of the arms embargo in the Neutrality Act of 1937 was rejected by the close vote of 12 to 11 in the Senate Committee on Foreign Relations (July 11) after a long and bitter debate.

On the other hand, Congress unhesitatingly granted the President's request for the strengthening of national defences, appropriating \$1,700,000,000 for the military, naval and air forces, the largest peacetime defence budget in U.S. history; and its appropriation of \$1,194,000,000 for agricultural relief actually exceeded the President's recommendation by some \$300,000,000—a rare phenomenon. On May 1 Congress passed the Reorganization Bill (defeated the previous year) authorizing the President to make sweeping changes and consolidations in the various Federal boards, commissions and authorities, by which he gathered 17 independent and often overlapping administrations into three: the Federal Loan Agency under Jesse Jones, the Federal Works Agency under John Carmody, and the Federal Security Agency under Paul V. McNutt. These three men, though not of cabinet rank, were invited frequently by the President to sit with the cabinet. Altogether, the appropriations for the fiscal year 1939-40 were \$13,000,000,000, an increase of \$2,000,000,000 over the previous year and the largest since the World War.

With the outbreak of the European war at the beginning of September, the President, convinced that the arms embargo threatened rather than guaranteed the neutrality of the United States, called Congress in extra session on September 21 to urge again the repeal of the embargo. Calling attention to the unsuccessful efforts which the U.S. Government had made to prevent the outbreak of "the present appalling war," he declared that the U.S. must lose no time or effort to keep the nation from being drawn into it. He assumed that every member of Congress and the executive departments was "without reservation in favour of such measures" as would protect American neutrality. The only question was what measures were best calculated to accomplish that end. His plea was for a return to the "traditional and historic American policy" of reliance on international law, which put the land powers and the sea powers on the same footing, and the end of the embargo which penalized the sea powers and was therefore unneutral. He would surround the new policy (or rather the old policy which had been abandoned in 1937) with certain safeguards, such as the closing of danger zones to American merchant vessels, the prevention of American citizens from travelling on belligerent ships, the "cash-and-carry" provision of the former law and the denial of war credits to belligerent nations. He saw no reason for other than the revised neutrality legislation in this extra session, and asked the leaders of the two major parties in Congress to remain in Washington for consultation and advice until the meeting of the next regular session in Jan. 1940. After a spirited de-

bate, the Senate, by the unexpectedly large majority of 63 to 30, repealed the arms embargo on October 27, Senator La Follette losing his amendment for a popular referendum on the declaration of war by 17 to 73. The House, on November 2, supported the repeal, and the extra session immediately came to an end. (See also NEUTRALITY.)

The Budget.—No progress was made during the year 1939 toward balancing the Federal budget. On the contrary, the expenses for the fiscal year (\$9,250,000,000) exceeded the receipts (\$5,670,000,000) by \$3,580,000,000, marking the ninth successive year of deficits and bringing the national debt up to \$41,500,000,000. The President's budget message of Jan. 1939, called for expenditures of some \$9,000,000,000 for the fiscal year ending June 30, 1940, with estimated receipts of \$5,700,000,000. The addition of three-and-a-third billions to the national debt would bring the figure up to the very edge of the debt limit of \$45,000,000,000 fixed by act of Congress. The constant demand of the opponents of the administration (and, indeed, of many of its friends) that at least a beginning shall be made toward balancing the budget meets with arguments both theoretical and practical as to why the spending should go on. The President expressed his conviction that the continued "pump priming" will revive business and raise the national income to at least \$80,000,000,000, when the increased tax revenues will suffice to wipe out the deficit. This, notwithstanding the fact that the national income declined by about 9% in the last fiscal year and unemployment continued around the 10,000,000 mark. Furthermore, the administration asks as a practical question what items of present expense could be cut down. The fixed charges for running the Government and servicing the public debt must be met. The national defence program must be enlarged not curtailed. Relief must be continued. If, then, the reduction of expenses is impracticable, there remains only the hope for increased revenues through taxation. But, with a presidential year approaching, neither a Democratic administration which hopes for a renewal of power nor Senators and Congressmen who look forward to re-election will be keen to assess new taxes. The balancing of the budget begins to look like as hopeless a problem as the squaring of the circle. (See also BUDGET.)

The Farm Problem.—Though the elaborate Agricultural Adjustment Act of 1938, aiming at the attainment of an "ever normal granary" and providing for plebiscites among the farmers of specified crops on the adoption of quotas, was not altered during the year 1939, there was nevertheless much discussion over the ways and means of making the act effective, and there were many plans proposed for further improvement of the farmers' status. It was

A RIOT OF WPA WORKERS, during which a policeman died, was staged in Minneapolis July 10, 1939, as part of a national strike against longer working hours

evident that this grave problem was far from being solved, and that the agricultural situation would be an important issue in the campaign of 1940. On Dec. 19, 1939, the Department of Agriculture estimated the total farm income for the year at \$7,625,000,000, as compared with \$7,632,000,000 for the previous year and with \$10,479,000,000 for the year 1929. On the other hand, while the appropriations of the department were only \$166,000,000 in 1929, they had risen a decade later to the huge sum of \$1,213,400,000. Government payments to farmers during 1939 reached \$675,000,000, or an average of \$97 a farm. Thus while the farmers' cash income increased by about 60% since the depression year of 1932, the Federal outlay for farm relief grew by 312%. In spite of such large expenditures (which led the President in a statement, of Dec. 19, 1939, to declare that the coming session of Congress should provide new taxes for the agricultural deficits), the problem of undisposed surpluses of farm products remained unsolved.

The cotton situation was especially acute. There were some 11,500,000 bales of cotton stored in barns and warehouses of the South, on which the Government has loaned \$600,000,000, or over \$50 a bale. Various plans have been proposed for disposing of this surplus, reminding one of the remedies proposed in the McNary-Haugen bills of a decade and more ago. For example, in 1938 a plan for the Government to set prices for the domestic sale of cotton and other farm products, determined by the U.S. cost of production, narrowly failed of passage in the Senate. Another scheme proposed was that farmers be allowed to buy back from the Government 3,000,000 bales of cotton at 5¢ a pound and sell it at the current market price of between 8¢ and 9¢. Senator Byrnes of South Carolina suggested bartering 2,000,000 bales of cotton and 100,000,000 bu. of wheat for supplies of rubber and tin, which the colonial possessions of Great Britain and the Netherlands have in abundance and which the U.S. might store against eventual needs—a policy diametrically opposed to Secretary Hull's anti-bilateral and anti-barter trade pacts. Finally, a conference of 10 cotton exporting countries has been proposed to find a way of stabilizing the cotton production and trade. None of these schemes, however, came to fruition in the Congress of 1939. About a week before the close of the first session in August, Senator Lee of Oklahoma got before the House Committee on Agriculture a bill to make \$350,000,000 available for 40-year loans at 3% to tenant farmers for the purchase of farms, including Government insurance of loans made by private agencies. This was to supplement and greatly enlarge the Bankhead-Jones Act of 1937 for the relief of tenant farmers, under which only \$35,000,000 had been loaned by the Farm Security Administration to some 8,000 out of several million tenants. Farm tenancy and share cropping, though the latter is somewhat diminishing, burdened over 40% of the farms of the country, with their 32,000,000 residents. It is no wonder that President Roosevelt has called the South, where most of this burden rests, "the country's number one economic problem."

A novel experiment was undertaken in 1939 in the distribution of food supplies to the people. Heretofore the Federal Surplus Commodities Corporation has purchased and distributed to the needy large quantities of foodstuffs gratis, much to the embarrassment of the retail food dealers. Beginning in Rochester, N.Y., and spreading to six other cities during the year, a new device was tried. The beneficiaries of relief were allowed to take part of their monthly payments in orange and blue stamps issued by the FSCC, the orange stamps being good for the purchase of food of any kind, and the blue stamps (of which the person received, as a kind of bonus, 50¢ worth for every dollar's worth of orange stamps he took) being good for the purchase of certain "enumerated" commodities of which a surplus existed. The grocer or

"WELL, WHAT ARE WE WAITING FOR?" This cartoon by Messner of *The Rochester Times-Union* appeared a few days before Congress passed the 1940 relief bill June 30, 1939

butcher who took these stamps in payment could turn them in at his bank as cash, and the Government reimbursed the banker. This scheme, which bids fair to spread further, has several advantages. It encourages the recipient of relief money to spend a larger share of it on the necessities of life; it permits the retail dealer to make his profit on the food sold; and it helps solve the anomalous situation of hungry people living in a land where food is spoiling.

Labour Problems; the A.F. of L. and the C.I.O.—In spite of repeated efforts by the President and by Secretary of Labor Perkins to bring peace between the A.F. of L. and the C.I.O., these rival factions in the labour union ranks continued their bitter fight all through the year 1939. In March the President summoned a conference to the White House (later adjourned to New York) to try to negotiate a "peace with honour" between the factions. But they proved to be only farther apart than ever. The original rift, resulting from the secession and expulsion of ten unions of the A.F. of L. in the autumn of 1935, and their consequent formation into the Committee for Industrial Organization under the vigorous president of the United Mine Workers of America, John L. Lewis, had been widened by the phenomenal success of the C.I.O. in forming new industrial unions, in detaching unions from the parent A.F. of L., in securing contracts with big business corporations, and by conflicting views on the rulings of the National Labor Relations Board. The A.F. of L., calling its rival communistic, complained the Board favoured it unduly. The C.I.O. supporting the Board, accused its rival of being "aristocratic," dictatorial and reactionary. The battle was further complicated in Feb. 1939, by a split in the ranks of the C.I.O. itself, when the United Automobile Workers of America, the second largest union in the organization, with some 400,000 members, staged a lively fight between the president, Homer Martin, and the majority of the officers of the union. All that came out of the conference of

March-April was a proposal by Mr. Lewis (promptly spurned by the A.F. of L.) that the A.F. of L., the C.I.O. and the railroad brotherhoods should be merged into an American Congress of Labor, to be governed by an executive board representing the three organizations, but on which neither he nor President Green of the A.F. of L. should serve. The annual conventions of the A.F. of L. and the C.I.O. (the former at Cincinnati on October 2, and the latter at San Francisco on October 9) were notable for the expression of mutual defiance, Mr. Lewis boasting that in five years the membership of the Congress of Industrial Organizations, as the C.I.O. had been renamed, would reach 10,000,000.

Strikes.—During the first seven months of 1939 the number of strikes reported by the department of labour averaged 192 a month, as compared with 231 a month in 1938 and 395 in the prosperous year of 1937. The most serious strike was in the bituminous coal field. On April 1 the contract of the United Mine Workers of America (C.I.O.) with the operators expired, and the latter refused to renew the contract on the terms which Mr. Lewis demanded: namely, the closed shop and the abolition of the "penalty clause." The former demand would oblige the companies to hire no workers but members of the U.M.W.A., and the latter demand was for the omission of the penalty of a dollar a day on every worker who participated in a strike without the sanction of the union. At Mr. Lewis' bidding 420,000 miners laid down their tools, and in May the shortage of coal became serious. Subway trains were cutting their schedules by 25%. After a struggle of six weeks, and in spite of the organization of a rival group, the Progressive Miners of America, affiliated with the A.F. of L., the United Mine Workers, who comprised over 90% of the bituminous miners, won a complete victory. Eighty per cent of the operators yielded to the demands of Mr. Lewis and signed a two years' contract. The most conspicuous hold-outs were the operators of Harlan, Kentucky, "bloody Harlan," where violence continued until Governor Chandler called out the State troops.

The longest strike of the year (54 days) began on October 6, when about 50,000 men in the plants of the Chrysler Automobile Corporation staged a "slow-down" strike patterned on the old "ca' canny" or slacking policies. The contract of the Corporation with the C.I.O. expired on September 30, and the workers demanded in a new contract a wage increase of 10¢ an hour, the closed shop, arbitration of disputes by a joint appeals board, and a voice in fixing production schedules. The strike was ended late in November by an agreement on the whole favourable to the company. A wage increase of 3¢ an hour was granted, as was the arbitration demand; but the union failed to get either the closed shop or a voice in determining the production schedules. Other strikes worthy of note during the year were one of a month's duration (July-August) by the tool and die workers of General Motors, which was settled to the advantage of the United Automobile Workers of America, and a strike of the International Longshore-

men's Association (A.F. of L.) in November, which tied up more than 70 passenger and freight vessels on the Atlantic seaboard.

An unprecedented kind of strike was inaugurated in the mid-summer of 1939 when a number of skilled workers on the WPA rolls laid down their tools in protest against the revision of the WPA rules by act of Congress of July 1. The question was whether the skilled worker should receive the "prevailing" (union) wage as if he were employed in private industry, or merely a "security" wage as a beneficiary of Government aid. Before the change of July 1 a compromise had been in effect, satisfactory to the unions, by which a worker received the prevailing wage per hour but worked many fewer hours than the unskilled. So that the actual income of the skilled worker was far less than it would have been had he had steady employment in private industry. The new law required that all WPA workers should put in 130 hours a month, or five six-hour days per week, which, of course, reduced the hourly wage of the skilled worker far below the prevailing union wage; and the argument of the disgruntled workers was that the law would force down wages generally in the skilled industries. The administrator of the WPA, Colonel F. C. Harrington (who had succeeded Harry Hopkins when the latter took the place of Daniel C. Roper as Secretary of Commerce) refused to give any comfort to the strikers. When some 20,000 of the men failed to report to WPA headquarters for five days they were promptly mailed their "pink slips," or notices of dismissal. President Roosevelt, in words recalling Calvin Coolidge's rebuke to the striking Boston policemen, dismissed the matter curtly with the remark "You cannot strike against the Government." The WPA being a non-profit organization supported by the tax-payers, a strike in its ranks was little less than ridiculous. The head of the A.F. of L. did not support it, and sympathetic members of Congress, who had at first introduced bills to restore the "prevailing" wage, saw fit to let them die. Thus ended what the wits called the "mutiny on the bounty." (See also STRIKES AND LOCK-OUTS.)

The NLRB.—Dissatisfaction with both the National Labor Relations (Wagner) Act of 1935 (which allowed only labour to call for elections to determine which union should bargain with the employers) and the rulings of the National Labor Relations Board continued through the year 1939. The first of these complaints was remedied at the beginning of July, when the board announced that employers as well as workers would be permitted to call for an election. But the charges of unfair discrimination in favour of labour in the rulings of the board persisted. A break in favour of the employers came in March with a six to two decision of the Supreme Court (Justices Reed and Black dissenting) reversing the order of the board to the Fansteel Metallurgical company to re-hire men discharged in the sit-down strike of 1937. Chief-Justice Hughes in reading the opinion declared that the sit-down strike was "a high-handed proceeding without a shadow of legal right." So clamorous was the criticism of the NLRB by both employers and one faction of labour (the A.F. of L.) that the House, before the adjournment of Congress in August, appointed a committee of five to make an investigation of the board, with the purpose of possible changes in the National Labor Relations Act. The committee mailed tens of thousands of questionnaires to labour unions, employers, law professors and police chiefs, requesting information on the economic effects, the legality and the social consequences of the board's rulings. What effect the report may have on Congress and the presidential campaign of 1940 remains to be seen.

Labour and the Anti-trust Laws.—Meanwhile no little concern has been created in the ranks of labour by the activities of Thurman Arnold, lately law professor at Yale and author of *The Folklore of Capitalism*, who is assistant attorney-general in charge of the enforcement of the anti-trust laws. The Clayton Act of 1914,

MANUFACTURING PRODUCTION in the United States; Federal Reserve Board Index, without adjustment for seasonal variation

RECEIPTS (....) AND EXPENDITURES (—) of the Federal Government in fiscal years ended June 30; with surplus or deficit shown below. Receipts for 1940 include \$537,355,000 of net transfers to old-age reserve account

by its sixth and twentieth sections, seemed to exempt labour organizations from the penalties of those laws. But Mr. Arnold, in the zealous prosecution of his duties, listed a number of practices by the labour unions which he declares infractions of the law. Such are (1) preventing the use of cheaper materials or improved equipment for the sake of creating more jobs, (2) for the same purpose compelling firms to hire unnecessary workers, (3) combining with producers and distributors to fix illegal prices. He brought indictments against building trade unions in St. Louis, Detroit and Washington for violations of the anti-trust laws; and he was upheld by Attorney-General Murphy, who contended that "the policy of enforcement should not vary according to individual views of the official charged with enforcement." If Mr. Arnold draws the unions into the net of the anti-trust laws, one may question whether the Clayton Act will continue to be, in Gompers' words, "the Magna Carta of American labour."

Transportation. The Railroads.—The business recession of 1937–38, added to increased taxes and the competition of buses, pipe lines and water-borne traffic, led the railroads in the summer of 1938 to propose a reduction of 15% in wages, the ICC having refused to grant them the increase in freight rates which they asked. The threat of wage reduction was answered by counter-threat of a general strike on Dec. 1, 1938. Meanwhile a fact-finding committee created by the President reported (Oct. 1938) that,

compared to wages in other industries, the railway wages were not too high, and noted that the more prosperous railroads could well afford to pay the present wages. While not legally compelled to accept the report of the President's committee, the roads acquiesced and the strike was averted. It was recognized, however, that something must be done to help the railroads out of a slump which had sent the average price of their bonds down from \$95.59 in 1930 to \$55.92 in Aug. 1938, and their stock from \$91.56 to \$26.06 a share. But contrary to the predictions at the end of 1938, the 76th Congress took scarcely any notice of the railroad problem. Meanwhile an innovation in railroad travel was bringing in added revenues and bade fair to rescue the passenger traffic from the doldrums into which it had fallen since 1932. That innovation was the fast streamlined train, like the Burlington "Zephyr," the Santa Fe "El Capitan," the Rock Island "Rocket" and now more than 75 others, which, without increase in fares, are carrying thousands of passengers and making substantial earnings. An index of improving traffic conditions was a reduction in round-trip fares announced by the eastern roads in June 1939, which saved, for example, \$14.85 on a round-trip ticket from New York to Chicago. The rate in 1939 was a little less than 2¢ a mile, a figure against which the roads protested vigorously when it was imposed by the ICC three years before. (See also RAILROADS.)

The Merchant Marine.—With the establishment of the Maritime Commission in 1936, to replace the United States Shipping Board set up 20 years earlier as a war measure, the U.S. began seriously to tackle a problem of first rate importance for its foreign trade, commercial autonomy and the adequate supply of transports and personnel for the U.S. navy. Under the vigorous chairmanship of Joseph P. Kennedy (later ambassador to Great Britain) an elaborate program was adopted, calling for the construction of 500 merchant ships over a period of 10 years, at a cost of \$125,000,000 a year, with generous subsidies by the Government. The report of the Commission to Congress in Feb. 1939, was encouraging. "The long and dangerous decline of our merchant fleet," it said, "has been checked and the process reversed. . . . Prospects for the return of the American flag to a place upon the seas commensurate with our country's position as a world power are the brightest in many years." Up to July 1, 1939, contracts for 67 ships costing \$185,000,000 had been let, of which 24 were to be built for private account with Government aid, and the remainder disposed of to private buyers if they could be found, and if not, to be operated by the commission. Notable among the new additions to the merchant marine were the "Good Neighbor Fleet" of three finely reconditioned 13,000 ton vessels, the "Uruguay," "Argentina" and "Brazil," serving the east coast of South America from Atlantic ports, and the 26,000 ton "America," the largest ship ever built in American yards, to be put in commission in 1940 as the flagship of the American line. Her cost to the Government will be \$17,000,000, but she will be sold to the line for \$10,500,000. More than 50 fast cargo carriers and tankers are also on the list. The U.S. may, therefore, look forward in the near future to the end of the era which saw about 70% of U.S. freight and passengers carried on ships flying a foreign flag. The yards at Fore River, Camden, Newport News and San Francisco hummed with activity during 1939.

There was, however, one fly in the ointment: the effect which the cash-and-carry clause in the Neutrality Act will have on American shipping. Not counting the ships in the Great Lakes and the coastwise trade, there are now 44 Government owned and 282 privately owned vessels in the U.S. merchant marine. The ban in the Neutrality Act forbidding American ships to carry materials to the ports of belligerent countries (except where there are no hostilities actual or threatened) or to enter the danger zones proclaimed by the President, is estimated to affect 6,000 American

THE U.S. NEUTRALITY ACT, major legislative problem of 1939, "looked like serious business" to Hutton of *The Philadelphia Inquirer*

seamen and to threaten a loss of over \$50,000,000 a year to American shippers. What it will mean in the deterioration of idle ships and the loss of trade routes to foreign competitors no one can say. Immediately after the passage of the act early in Nov. 1939, nearly a score of American tankers changed their registry and the United States Lines petitioned the Maritime Commission for permission to transfer a number of its ships to the flag of Panama and to operate them with no American citizens in the crew. The President took the request under advisement and on November 21 pronounced against the petition. Congress was disposed to cause as little harm to the shipping interests and to American trade as possible; but the primary consideration is the avoidance of war. A ship under Panamanian registry would still be owned by Americans, and if it was sunk by a submarine the danger to U.S. peace would be hardly less than it would be if the ship were flying the American flag. Some sort of Government compensation to U.S. shippers for their losses may be devised. (See also SHIPPING, MERCHANT MARINE.)

Aviation.—This section will treat of civil aviation only: military aviation will come under the heading *National Defence*. A report issued by American Airlines, Inc. on Dec. 24, 1939, showed an increase of 44.7% in revenue passenger miles flown during the first 11 months of 1939 over the figure for the corresponding months of 1938. The report listed 488,664 passengers carried, as against 329,348 in 1938, and an income of \$7,452,209, or 42.4% gain over the \$5,233,194 of the previous year. The splendid record for safety and for the regularity of schedules made by the domestic airways in 1938 was maintained during 1939. At the close of the year more than 400 daily scheduled flights (or one every 3-6 minutes) were being made over the expanding air routes of the country. Some 250 passengers a day were being carried

by plane between New York and Chicago. On December 2 the huge LaGuardia Field at North Beach on Flushing Bay, Long Island, was opened, and before the end of the year the daily landings and take-offs mounted to 150, over 2,500 passengers arriving or leaving on the banner day. The 80,000 word report of the Civil Aeronautics Authority to Congress in April declared that the existing airports were inadequate in space, lighting, and equipment, and recommended the expenditure of \$435,000,000 to provide 3,500 ports of the most modern type. Already Congress had provided for the training of 20,000 young pilots between the ages of 18 and 25 to receive 50 hours of instruction each at an estimated expense of \$7,000,000 to the Government. The best of these men were to be retained for further training for national defence. The most important event of the year in aviation was the inauguration of mail and passenger service across the Atlantic. At the beginning of the year Pan American Airways, which has had a virtual monopoly of U.S. foreign flying routes, was building six 40-ton Boeing planes, designed to carry 74 passengers across the sea, and negotiations were made with Portugal and France for landing privileges at the Azores, Lisbon, and Marseilles. Incidentally, England was loath to grant such privileges, because she was announcing the early inauguration of the British Imperial Airways' mail and passenger trans-Atlantic service—not yet begun, however. On May 20 the Pan American "Yankee Clipper" made the first flight from New York to Marseilles, carrying 100,000 pieces of mail. The passenger service was inaugurated on June 28, with a schedule of two (later to be increased to four) round trips a week. The 35 passengers, leaving New York in the afternoon, woke the next morning at the Azores and were in Marseilles before sunset. In the first 6 months of service clippers made 100 crossings without a mishap and have carried 1,700 passengers and over 40 tons of mail. With the war interrupting the regular trans-Atlantic mail service, except for the Italian, Dutch, and Scandinavian ships, air transportation has come at an opportune moment. Probably the next step in aviation will be the "air flivver" or inexpensive small plane, on which much promising work has already been done. In recording the triumph of the trans-Atlantic clippers tribute should be paid to Igor Sikorsky, who has devoted the 20 years of his life in America, since he fled from Bolshevik Russia, to the designing of long distance planes. It was he who built the 17-ton clippers used in the trans-Pacific flights.

The Supreme Court.—At certain times in U.S. history, as in the administrations of Jackson, Lincoln, and Taft, the event of death or retirement has given the President the opportunity to appoint a majority of the members of the Supreme Court. During the first administration of Franklin Roosevelt no vacancy occurred on the bench, but in the last two years he has had no less than five such places to fill. Justices Van Devanter and Sutherland (retired) and Justice Cardozo (deceased) were replaced in 1937-38 by Senator Hugo L. Black, Solicitor General Stanley F. Reed, and Professor Felix Frankfurter respectively. In Feb. 1939, the 82-year-old Justice Louis Brandeis, a Wilson appointee of 1916, resigned, and the President nominated in his stead William O. Douglas of Minnesota, former professor at Yale and chairman of the Securities and Exchange Commission, to be the youngest member of the court (40). Pierce Butler of Minnesota, a Harding appointee of 1922 and a conservative corporation lawyer, died in November. The President deferred the naming of his successor (Frank Murphy) until the meeting of the third session of the 76th Congress in Jan. 1940. The new appointments have naturally changed the complexion of the Court, eliminating all the opponents of the New Deal except Justice McReynolds, the most intransigent of them all. On April 17 the Court by a vote of six to two ruled the Agricultural Adjustment Act of 1938 constitutional. (It will be recalled that the AAA of 1933 was declared unconstitutional

by a unanimous decision of the court on Jan. 6, 1936.) We have already noted the Court's reversal in March 1939, of the *Fansteel* order of the NLRB. Another important decision, the next month, upheld the power of the Federal Government to tax the salaries of State employees (more than 2,500,000 in number) and the reciprocal right of the State Governments to tax the salaries of the 1,200,000 Federal employees. To those who interpreted this as a reversal of Marshall's decision in *McCulloch vs. Maryland* (1819) it was pointed out that the latter case concerned the interference of a State with the operations of a Federal corporation by taxing the business transactions of a branch bank of the United States, whereas the 1939 law was to tax only the personal incomes of the Federal servants. The Court's decision in the *Joe Strecker* case (April 17, 1939) was expected to furnish a precedent for dealing with Harry Bridges, an alien labour agitator on the Pacific coast, who belonged to the Communist party. As Strecker had ceased to be a member of that party, the Court supported his right, though an alien, to remain in the country. On December 29 special investigator J. U. Landis found no cause for the deportation of Bridges.

Foreign Trade.—The boom in foreign trade which was predicted on the outbreak of war in Europe, and was predicated on the enormous increase of U.S. exports during the World War (1914-18) failed (at least, in 1939) to occur. For the first two months of the war (September and October) U.S. exports showed a rise almost exactly parallel to that of the corresponding months of 1914; but in November, in spite of more than a 100% increase over October in the export of aircraft, total exports fell off considerably, those to the United Kingdom, for example, declining from \$55,634,000 in October to \$42,439,000. This has been explained partially by the fact that Great Britain is buying as much as possible in her own dominions (wheat from Canada and wool from Australia) and is increasing her imports of food stuffs from South America to cut in on the German trade. But there were other factors at work to keep U.S. trade from swelling to the enormous figures it reached in the World War. We have already seen in the section on the *Merchant Marine* what a handicap on American trade is imposed by the terms of the 1939 Neutrality Act. It is impossible at this stage (Jan. 1, 1940) of the European conflict to predict what effect it will have on American commerce. If the war develops into a long and serious contest on land, Great Britain, and the other maritime belligerents may well be obliged, in spite of the U.S. ban on foreign loans and the demand for cash payments in American dollars, to come to America for large supplies of war materials and food. Meanwhile, U.S. merchant ships endeavoured to avoid being tied up in port by shifting their routes to permitted shores. The "Washington" and the "Manhattan," for example, were scheduled to run to Italy; and other lines to serve Spanish, Portuguese, and Latin American ports.

National Defence.—It was doubtless the general apprehension of the outbreak of war in Europe (especially after the failure of the Munich "appeasement" policy of Sept. 1938), and of the possible extension of war to the United States, that determined the ready response of the 76th Congress to the President's request for unprecedented appropriations for the national defence. A Gallup poll at the beginning of 1939 showed 82% of the voters in favour of large increases in the army, 84% for strengthening the navy, and 90% for a vast enlargement of our air forces. Shortly after his budget message including more than \$1,000,000,000 for defence, the President sent a special message to Congress (January 12), asking for an additional \$551,000,000. The House, in March, voted to increase the army's air force from about 2,000 to 5,500 planes, with generous appropriations for anti-aircraft guns, artillery, tanks, and improvements in the defences of Puerto

Rico, Alaska, Hawaii, and the Panama Canal. The army appropriation of \$499,800,000 for the fiscal year 1939-40 was the largest ever made by Congress in time of peace. A bill was also passed authorizing the Government to purchase large supplies of "strategic" material (See also STRATEGIC MINERAL SUPPLIES), not produced at home in sufficient quantities to carry the nation through a war, and a War Resources Board, with E. R. Stettinius of the United States Steel corporation as chairman, was appointed to co-ordinate the efforts of business, labour and the Government in supplying the hundred thousand articles which the country would need in time of war. More than \$65,000,000 was allotted to the navy, and two new 45,000-ton battleships were authorized, in addition to a large number of auxiliary craft. To guard against the establishment of enemy naval bases in American waters, from which bombing planes might threaten U.S. cities, the navy was directed to "develop and increase our naval facilities" at various points and to establish 12 new naval bases, nine of them on the Pacific islands. Interesting events of the year were the speed-breaking flight of a Curtis-Hawk pursuit plane (built in the U.S. for the French army) at the rate of 575 m.p.h., and the invention of the bakelite "plastic" plane which can be built at a third of the cost of the metal plane.

The Third Term Issue.—With the approach of a presidential year, 1940, a question uppermost in the discussion of domestic politics was, will President Roosevelt break an American precedent by running for a third consecutive term? A poll of the Institute of Public Opinion in May 1939 recorded only 33% in favour of a third term to 67 against it. In August the figures had changed to 40 and 60 respectively, and in October to 43 and 57; and in the last of these polls an actual majority (52 to 48) voted for a third term if the war in Europe continued until the nominating conventions met in 1940. Meanwhile, the President himself maintained a Sphinx-like silence on the subject, or passed off the attempts of his supporters to commit him with a humorous remark. As the year closed the outstanding candidates for the Republican nomination were District Attorney Thomas E. Dewey of New York, Senator Arthur H. Vandenberg of Michigan, and Senator Robert A. Taft of Ohio. The Democrats were embarrassed by the silence of their chief as to his intentions. A dozen or so of their prominent men, like Farley, Hull, McNutt, Wheeler, Clark, Tydings, and Speaker Bankhead, it was indicated, would respond to the call of their party if Roosevelt declined to run; but up to Jan. 1, 1940 only Vice-President John N. Garner actually threw his hat in the ring. A few days before the close of the year the papers announced that "definite information" had come from Washington that the President had told his friends that he did not wish to run in 1940; but, in 1939, no direct word from himself, like Coolidge's renunciation more than a year before the election of 1928, formally released his possible competitors. The sentiment in the country was strong against a third term. Twice Congress has passed a resolution to the effect that a third term would be inexpedient and fraught with danger to the Republican system. The fear that the nomination of a conservative Democrat might split the party, the conviction that the policies of the New Deal still need to be entrusted to the master hand that framed them, and the belief that President Roosevelt's popularity with the masses will insure his re-election if he is nominated led men like Secretaries Wallace and Ickes, Attorney General Jackson, Ambassadors Kennedy and Davies (on home visits from London and Brussels), and the Democratic governors of several States to urge a third term in spite of the established precedent. Furthermore, it seemed that a continuance of the war in Europe was likely (as the Gallup poll noted above indicated) to strengthen the sentiment for a third term. For no action of the President in 1939 met with more approval than his sincere and judicious efforts first to prevent the

CONGRESS "didn't know its own strength" in wrecking legislation sponsored by the New Deal in 1939, notes Thomas in *The Detroit News*

outbreak of war and then to encourage an acceptable peace. His April letters to Hitler and Mussolini, his success in the revision of the Neutrality Act in November, and especially his letter of December 23 to Pope Pius XII, offering his co-operation in the cause of peace and suggesting that it would give him "great satisfaction to send to you my personal representative in order that our parallel endeavours for peace and the alleviation of suffering may be assisted" won enthusiastic response throughout the country. As peace envoy to the Vatican the President appointed Myron C. Taylor, who had presided at the Evian conference on the refugee problem, and asked Dr. George A. Buttrick of the Federation of the Churches of Christ and Rabbi Cyrus Adler, president of the Jewish Theological Seminary of America to serve as aids by coming to Washington from time to time for counsel. Incidentally, Taylor's mission will be the first U.S. official connection with the Vatican (if President Theodore Roosevelt's dispatch of William H. Taft to the papal court in 1902 to arrange for the purchase of the church lands in the Philippines is excepted) since the last American minister to the Papal States, Rufus King of Wisconsin, left Rome in 1868.

Social Security.—The Social Security Act of Aug. 1935, which President Roosevelt declared the most important piece of legislation in his administration, was perhaps the "instrument" of social improvement most in need of the "machining down" of which the President spoke in his opening message to the 76th Congress. Both because of its immense scope in providing benefits for the aged, the unemployed and the disabled, and because it was hastened in order to check the alarming spread of unsound pension schemes like those of Dr. Francis E. Townsend, Father Coughlin and the late Senator Huey Long, it stood in need of revision. In the November elections of 1938 the voters in half a dozen States had the issue presented, and in California the "\$30-every-Thursday" ("Ham and Eggs") pension for persons over 60 years of age, a scheme sponsored by Sheridan Downey, who won the election to the United States Senate, failed of adoption by the narrowest of margins. The President sent a special message to Congress in Jan. 1939, recommending drastic amendments to the Act of 1935, and in the course of the year the following changes were made in the law: (1) certain classes of workers, like bank employees and mari-

time labourers who were not included in the original act, were admitted to its benefits (though farm labourers and domestic servants were still excluded); (2) the payments to persons of 65 who were covered by the old-age insurance were to begin on Jan. 1, 1940, instead of Jan. 1, 1942; (3) the assessments of 1% on wages and salaries which were to be paid by both employer and worker were "frozen" at that figure until 1943, instead of being increased to 1½% in 1940 as was provided in the original bill. The rate of contribution will be 2% each in 1943, 2½% in 1946, and 3% in 1949; (4) the scope of the act was widened to take in the family of the worker. His wife on reaching the age of 65 will receive a pension equal to half of her husband's, and a widow will get three-fourths her deceased husband's benefits. Also the children under 16 (or if they are going to school, under 18) will each receive the half pension. Under the original act the collections from the assessments in 1938 and 1939 reached the sum of \$966,000,000, and it was estimated that a fund of \$47,000,000,000 would be built up by 1980. The new amendments of 1939 will prevent the accumulation of this huge trust fund in the Treasury, and tend to equalize receipts and payments. It is estimated by the actuaries that until about the year 1955 the collections will exceed the payments by some \$7,000,000,000; but that this surplus will then begin to dwindle as more people reach the age of 65, with their claims to larger pensions on account of their longer years of service. However, the Government is content not to look now beyond the year 1955. About 45,000,000 Social Security accounts were on file at Washington in 1939. The Government expects to pay \$114,000,000 during 1940, \$430,000,000 in 1942, and so on in increasing amounts. The success of the liberalized law in checking the "wild-cat" pension schemes was shown by the decisive vote of 302 to 97 against the Townsend plan in the House, in June 1939, and the defeat of Downey's "Ham and Eggs" proposal in California and a similar Bigelow scheme in Ohio by two-to-one and three-to-one votes, respectively, at the November elections. (See also SOCIAL SECURITY.)

Housing.—One of the most disgraceful features of this uneven civilization has been the great number of families (estimated at 10,000,000 or about a third of the population) living in habitations unfit for human beings. How much the lack of a decent setting for home life contributes to the annual crime bill of \$15,000,000,000, the U.S. homicide rate which is the largest of all the civilized countries of the world, and the prolific production of youthful criminals it is impossible to say. What danger to the community is threatened by the disease breeding slums is evident to all. The United States Housing Authority, under its administrator Nathan Straus, has been attacking the evil of the slums with vigour. In a report of Dec. 15, 1939, he listed the elimination of 9,750 "substandard" dwellings in 26 cities and their replacement by 17,717 new ones, and cited more than 125 low-rent projects now under way. The rent problem is the crux of the situation. With three-quarters of the urban population living on incomes of less than \$2,000 a year, only 15% of the satisfactory dwellings come within the range of what such families can afford to pay for rent. The Home Owners' Loan Corporation and the Federal Housing Authority have helped thousands to borrow money on loans guaranteed by the Government to preserve and improve their habitations; but the need for low-cost houses and apartments is crying. In 1925 the U.S. built 937,000 new dwelling units and employed 2,400,000 workers in their construction. In 1933 these figures dropped to 54,000 and 656,000 respectively. By 1939 the country had recovered about half the figures of 1925, but still, even with generous Government aid, the U.S. is far from producing the accommodations which the growing population needs. Besides, when it is considered that the building industry is the largest consumer of lumber, cement, glass, brick, and

plumbers' supplies, we realize the depressing effect which this lag in construction has upon business recovery and renewed employment. Private interests have made their contribution to the solution of the housing problem. In Oct. 1939, a \$13,500,000 project was opened at Long Island city, consisting of 26 Y-shaped apartment houses to accommodate over 3,000 families at rentals of \$5.40 a month per room. And the Metropolitan Life Insurance company at a cost of \$50,000,000 was building "Parkchester," a group of 12,269 apartments to house 40,000 people, to be ready for occupancy in the spring of 1940. But even the lowest apartment rents (of \$32 a month) in the new buildings will be too high for any but the "middle class."

Latin-American Relations.—No progress was made during the year 1939 toward solving the crisis caused by the decree of the Mexican government on March 18, 1938, expropriating American owned lands valued at \$25,000,000 and American owned oil interests, over-valued by the companies at \$450,000,000 and probably worth about half that amount. For the lands, which President Cardenas has taken to distribute to the landless peasants, in a serious determination to carry out the policy of his former chief, the ill-fated President Madero, compensation has been promised; but the only concession to the oil companies is a right to claim compensation in the Mexican courts for their actual investments. The U.S. State Department made the proposal in August that the operation of the oil wells (which was being badly managed by the native managers) should be entrusted to a board representing the Mexican government, the American oil companies, and three neutral oil experts. But the offer was summarily rejected by Cardenas. On December 2 the Mexican Supreme Court upheld the expropriation of the oil properties by a unanimous vote, denied the companies any right to claim compensation for concessions, and declared that the government might delay recompense for investments for ten years. A few days later the arbitrary policy of Mexico recoiled upon her own head, when a Hull trade agreement with Venezuela reduced by 50% the tariff on a certain quota of foreign oil imported into the United States. Because American importers had boycotted Mexican oil, that country found itself deprived of all but a tiny percentage of the concession. Meanwhile, the U.S. Government, pledged to the "good neighbour" policy, had no thought of bringing force to bear on Mexico. President Cardenas' term in 1939 was drawing to a close, and he is not eligible for re-election in 1940. Should he be succeeded by a conservative candidate, the American oil interests expect some compromise, such as, for example, one suggested recently that the Mexican government set aside for instalment payments to American companies a percentage of its sales to foreign countries.

With the rest of Latin-America U.S. relations during the year 1939 were closer and more cordial perhaps than ever before. The cumulative effect of the "good neighbour" policy, announced by President Roosevelt in his inaugural address of 1933, and implemented by such actions as the repeal of the Platt Amendment, the withdrawal of the last American marines from Haiti, the negotiation of a dozen trade agreements by Secretary Hull, and the conciliatory attitude of the United States delegations at the Pan-American Conferences at Montevideo, Buenos Aires, and Lima, has been to remove in large part the fear of "Yankee imperialism" which troubled the minds of the sister republics to the South. A genuine Pan-Americanism (in which the United States is just as much, and not more, of the "Pan" as Bolivia or Honduras) is replacing the quasi-dictatorial interpretation of the Monroe Doctrine which would make the United States the protector of the Latin-American republics. The year 1939 saw many evidences of this community of interests, inspired to a considerable extent by the resolutions adopted by the eighth Pan-American Congress at Lima in the closing days of 1938. The most important of those

110 resolutions were: (1) an agreement among the American republics to consult on measures of common protection from aggression by foreign powers, especially the Fascist dictators; (2) the reduction of trade barriers; and (3) the improvement of the machinery for the preservation of mutual good relations and peace among the Latin-American countries. The trend away from reliance on the League of Nations to guarantee their "political independence and territorial integrity" and toward a greater confidence in a Pan-American solidarity has been marked. Nine of the Latin-American republics (including all the Central American States) had already severed their connection with the League, when Peru, in April 1939, gave notice of its withdrawal, leaving only one-half of the American States represented at Geneva. As this process of defection from the League has gone on, however, the ties between the United States and her southern sisters have grown closer. Several important South American officials were ceremonially welcomed at Washington during 1939, Foreign Minister Aranha of Brazil coming in February, President Somoza of Nicaragua in May, for example; while loans from the Export-Import bank in Washington to Brazil, Nicaragua, Chile, Cuba, Paraguay were planned to encourage financial stability in Latin-America and improve commercial relations there.

Latin-America is the richest producer of raw materials of all the regions of the world that are not under the control of some great foreign power, supplying 88% of the world's coffee, 42% of its silver, 16% of its wool, 15% of its sugar, and a goodly portion of its copper, nitrates, and oil. United States investments in Latin-America amount to nearly \$5,000,000,000, and U.S. trade there in 1939 totalled about \$1,000,000,000, far exceeding that of Great Britain or Germany, the nearest competitors. Yet, with the advantages the United States has in location and in political influence in Latin-America, U.S. trade with that region should be much larger than the 18 to 20% of its total foreign trade. Two events are calculated to further this interest. Trade agreements negotiated by Secretary Hull have now been made with 11 Latin-American governments, the latest being that of May 1939, with Ecuador and of November with Venezuela. Negotiations are also pending with Argentina, Chile, and Uruguay. The law of 1934 (renewed in 1937) empowering Secretary Hull to conclude these agreements expires on June 12, 1940. Opposition to its second renewal in the summer of 1940 has developed among three classes: the western farmers, who resent the competition of foreign food products; the high protectionists, who always oppose any entering wedge in the tariff walls; and Senators, always jealous of their privileges, who do not like the delegation of this power to the executive branch and demand that the agreements be ratified by the Senate like any other treaties. Mr. Hull and his associates have pointed to the excellent results of the score of trade agreements, covering countries with which the U.S. does over 60% of its commerce, and declare that a refusal to continue the arrangements would be to send us back to the "anarchy" of the Smoot-Hawley days. They have the enthusiastic support of President Roosevelt. A second aid to Latin-American commerce is the inauguration of the "good neighbour" fleet of fine steamers (the "Argentina," the "Brazil" and the "Uruguay"), noted in the section on the *Merchant Marine*.

Numerous conferences among the Latin-American States during 1939 showed a growing solidarity of interests, especially stimulated by apprehension as to what effect the European war may have on the countries on this side of the Atlantic. In February co-operation in air lines was planned. In March an International Congress of American Democracies met at Montevideo to consider ways and means of strengthening republican institutions against the threat of Fascist penetration. A conference of 21 American nations at Panama approved of the Declaration of Panama, on

October 2, fixing a 300-mile limit of the American shore, in which the belligerent powers were asked not to conduct naval operations. And Brazil, Argentina and Uruguay agreed to pool their navies to patrol the 6,000mi. of the east coast of South America from the mouth of the Amazon river to Cape Horn. Hitler sneered at the Lima Conference of Dec. 1938, as "the American failure number one." But Thomas Ybarra may be nearer the truth when he asserts (in "America Faces South") that "perhaps a genuine Pan-Americanism was born at Munich."

Foreign Relations: Japan.—The outstanding event of the year 1939 in U.S. relations with Japan, which had been far from harmonious since the isolated protest of Secretary of State Stimson against the Japanese seizure of Manchuria in 1931, was the notification of Secretary Hull to the Japanese government on July 26 that the commercial treaty of 1911 would be terminated at the end of the prescribed time limit of six months (Jan. 26, 1940). This action was an example of President Roosevelt's warning, in his address to Congress on January 4, that there were "many methods short of war, but stronger and more effective than words, of bringing home to aggressor governments the aggregate sentiments of our own people." For it was undeniable that Japan, in spite of protests against the infraction of the Nine Power Treaty of 1922 and the Kellogg Peace Pact of 1928, was pushing on ruthlessly toward the conquest of China. Every sign of weakness on the part of the western powers, like the surrender at Munich, encouraged her in a new move of aggression. And the "aggregate sentiments" of the American people were clearly shown in polls which condemned Japan and advocated a boycott against her commerce by a majority of over 70%. The acts which led immediately to the denunciation of the 1911 treaty were Japan's threat to attack the international settlement at Shanghai on May 9; and her direct assault a few days later on the British and French concessions at Tientsin, put all foreigners in jeopardy. Despite repeated assurances that no harm to foreign interests was intended and prompt apologies from the civil power in Japan for harm inflicted, it was evident that a determined group of the younger military officers was in the saddle at Tokyo, who would stop at nothing to establish an exclusive domination over China. Now, the abrogation of the treaty of 1911 would release the United States from its obligation to deal with Japan on "the most favoured nation" basis and open the way, should the U.S. so desire, to lay that embargo on her commerce which Senator Pittman, chairman of the Committee on Foreign Relations, has long been advocating. Since Japan has been getting more than half her war materials from the United States, the seriousness of an embargo on arms, ammunition, cotton, steel and scrap metal is evident to her statesmen; it has been rumoured that Secretary Hull and Ambassador Horinouchi in Washington, as well as Ambassador Grew and Foreign Minister Nomura in Tokyo, have been at work on new treaty terms which may improve U.S. relations with Japan. The Japanese, meanwhile, announced (December 23) their readiness to reopen the Yangtze river as far up as Nanking to foreign ships; and a statement at the same time from the U.S. Treasury Department that no tariff discriminations or punitive harbour charges against Japan were contemplated has relieved the merchants of both countries from much of their anxiety over the proposed abrogation of the treaty of 1911.

The matter resolves itself into a question of American indignation over the political and military aggressions of Japan in China versus the interests of U.S. trade with Japan. The United States is Japan's largest customer, purchasing about 70% of her chief export commodity, raw silk. Next only to Canada and the British Isles, Japan is also the best customer of the United States.

United States trade with her is many times that with China, in spite of the manifest sympathy of the American people with the

Chinese and the enormous potential market of the Celestial Empire. For example, of the total U.S. trade with the Orient in 1939, 43% was with Japan, as against only 14% with China. It is certain that American merchants, whatever be the fate of the 1911 treaty, will strive to maintain this trade; but, on the other hand, they will view with alarm any military and naval development of Japan which would give her control over the sources in the far East (like the Philippines or the Dutch Indies) whence the U.S. draws many indispensable products, like rubber, tin, camphor, vegetable oils, hemp, jute, chromium and other non-American commodities.

Roosevelt and the Dictators.—When it became evident that the concessions made to Hitler at the Munich conference of Sept. 1938, failed to deter him from his course of aggression, anxiety over the outbreak of another European war which might involve the United States grew more serious. In March 1939, the Fuehrer entered the Czech capital of Prague and proceeded, through the military and then the secret police (the Gestapo), to reduce the whole of Czechoslovakia, whose independence he had solemnly guaranteed, to a vassal state. On April 7, Mussolini seized Albania. A week later President Roosevelt, who had already sought by telegrams to Hitler and President Benes to bring about a peaceful settlement of the Sudeten crisis, sent messages to both Hitler and Mussolini, asking them to agree for a period of 10 years not to attack any of 31 weaker nations which he listed, and promising that, in case they so agreed, he would request these nations to give a counter-pledge not to attack Germany or Italy. Hitler replied in a long speech before the German Reichstag on April 28, in which he justified his behaviour, boasted of the unconquerable might of the Third Reich, and heaped sarcastic abuse on President Roosevelt as a meddler who had no understanding of the situation. Having extinguished the liberty of Czecho-Slovakia, Hitler's next step was to demand Danzig and a German zone through the Polish Corridor. As the situation grew tense, the President again interceded, with telegrams (August 24) to Hitler, the President of Poland, and the King of Italy, urging arbitration, mediation, or direct negotiation for the settlement of the dispute. But again Hitler ignored the pleas for peace, and, having made a most unnatural alliance with Soviet Russia, ruthlessly invaded Poland on September 1. The unhappy country, caught between the armies of Hitler on the west and Stalin on the east, was reduced to submission, with frightful slaughter, in a month's time. This final outrage of the Fuehrer brought England and France, the guarantors of Poland, to the end of their patience, and on September 3 they declared war on Germany. The outbreak of the European war also brought President Roosevelt, who, with the unanimous approval of the American people, had made such extraordinary efforts for the preservation of peace, to call Congress in the extra session (noted above) for the revision of the Neutrality Law. As the year closed, it was impossible to answer the questions on everybody's lips: Will the war be long? Will it develop, as it has not yet, into a death struggle between the totalitarian dictators and the democracies of western Europe? Will the U.S. be drawn into it? Will some "incident" involving the loss of American life or property, despite all the safeguards with which the U.S. has been able to surround them, prove too much of a strain on American neutrality? Will the appeal to save democracy again cause the United States to throw its physical as well as its moral strength into the fight against the dictators? The experience of the American merchant vessel "City of Flint," stopped in the mid-Atlantic, in October, by a German warship and taken to the Russian port of Murmansk, contrary to international law, shows how little regard for American rights will be shown by desperate belligerents; and the battle off the estuary of La Plata, resulting in the blowing up of the German pocket battleship "Graf

Spee," together with the "suicide" of the German liner "Columbus" off the New Jersey coast, and the internment of her crew at Ellis island, in December, show that the war may come still closer to American shores. Eternal vigilance and sane statesmanship must be exercised to preserve the blessing of peace for the United States. Transportation.—For statistics on transportation and communications see the articles AVIATION, CIVIL; ELECTRIC TRANSPORTATION; MOTOR TRANSPORTATION; MOTOR VEHICLES; POST OFFICE; RAILROADS; SHIPPING, MERCHANT MARINE; TELEPHONE.

Agriculture.—For the second successive year, agricultural production declined from the record output of 1937. The acreage for harvest in 1939 was estimated at 317,957,000 as compared with 329,908,000 in 1938. Actual production declined in approximately the same ratio. Notable individual exceptions were corn, which according to preliminary estimates had record-breaking yields (more than 51 bu. per acre) in Indiana, Illinois and Iowa; and tobacco and soybeans, both of which were bumper crops.

Production figures of selected crops for the last eight years (000 omitted) are as follows:

Year	Corn	Oats	Wheat	Cotton	Cottonseed	Tame Hay	Rice	Tobacco	Potatoes
1932	2,931,281 bu.	1,259,955 bu.	756,927 bu.	13,093 bales	5,784 tons	71,827 tons	41,619 bu.	1,017,317 lbs.	376,425 bu.
1933	2,399,632	733,186	551,683	13,049	5,806	66,530	37,651	1,371,131	342,306
1934	1,461,123	544,306	526,393	9,636	4,282	55,270	39,047	1,081,629	406,105
1935	2,363,747	1,194,902	626,344	10,638	4,729	78,138	38,784	1,297,155	386,380
1936	1,507,089	785,506	626,766	12,399	5,511	63,536	49,002	1,154,131	334,918
1937	2,644,995	1,146,258	873,993	18,946	8,426	71,785	53,364	1,553,405	391,289
1938	2,542,238	1,053,839	930,803	11,943	5,400*	80,299	52,303	1,378,534	371,617
1939*	2,591,063	944,230	739,445	11,792	..	75,023	52,204	1,659,409	361,765

* Preliminary.

Livestock shipments at public stockyards were, with the exception of sheep, larger in the first ten months of 1939 than in the comparable period of 1938. Total shipments of cattle through October were 4,990,000 (4,925,000 in the same period of 1938); calves, 2,276,000 (2,058,000); hogs, 5,735,000 (5,539,000); and sheep, 10,304,000 (10,916,000).

The following table lists average prices received by farmers for important crops on selected dates (all in cents):

	Wheat per bu.	Corn per bu.	Oats per bu.	Barley per bu.	Rye per bu.	Buck- wheat per bu.	Pota- toes per bu.	Eggs per doz.	Cot- ton per lb.
Oct. average, 1909-13	88.1	64.8	38.4	60.5	72.0	71.1	65.0	23.8	12.10
Oct. 15, 1936	106.8	97.9	43.1	84.2	80.4	78.3	97.9	27.6	12.23
Oct. 15, 1937	88.7	58.9	28.8	52.0	63.8	62.4	48.5	25.2	8.10
Oct. 15, 1938	52.2	41.9	22.1	36.1	32.9	54.5	51.0	27.1	8.53
Oct. 15, 1939	70.3	47.6	30.3	42.2	45.1	62.7	66.4	22.9	8.73

See also AGRICULTURE and the articles on individual agricultural products.

Manufactures.—The last biennial census of manufactures taken by the U.S. Department of Commerce was published in Dec. 1938 and was for the calendar year 1937. The leading industries according to value of products were in the following order: motor vehicles and parts; steel-work and rolling-mill products; meat packing; petroleum refining; printing and publishing; clothing (excluding shoes, hosiery and millinery); electrical machinery and supplies; bread and bakery products; tobacco products; and cotton manufactures. The total number of manufacturing establishments in 1937 was 166,793; salaried employees, 1,216,993; wage earners, 8,569,578 (average for year). Salaries amounted to \$2,716,473,756 and wages \$10,112,808,089. Total value of all U.S. products was \$60,710,072,958.

Foreign Commerce.—The United States had a favourable trade balance of \$738,381,000 for the first 11 months of 1939, compared with a favourable balance of \$1,036,415,000 in the equivalent period of 1938. Exports in 1939 decreased fractionally, while imports rose more than 15%. Foreign trade in merchandise for the first 11 months of 1938 and 1939 by continents was as follows:

U.S.A.	Europe	N.America	Asia	S. America	Africa	Oceania
1938 exports	\$1,213,209	\$687,211	\$463,770	\$271,174	\$105,206	\$84,926
Imports	513,559	453,308	519,404	238,070	50,527	14,207
1939 exports	1,128,877	729,759	491,817	285,159	103,770	70,191
Imports	559,963	530,535	609,859	279,808	66,684	24,346

By the end of 1939, exports to Germany were practically non-existent. The U.S. Bureau of Foreign and Domestic Commerce reported exports of only \$2,559 to Germany in Nov. 1939 (\$8,617,995 in Nov. 1938). Imports were \$2,656,055 (\$6,922,373 in Nov. 1938).

Petroleum was again the leading export in 1939, while rubber, non-ferrous metals, and coffee were the leading imports. Sugar, the leading import of 1938, fell to fourth place. Grain showed the sharpest decline among exports. Aircraft and aircraft parts rose from \$62,512,000 in the first 11 months of 1938 to \$88,016,537 in the same period of 1939.

Labour.—For data on labour in 1939, see the articles AMERICAN

FEDERATION OF LABOR; CONGRESS OF INDUSTRIAL ORGANIZATIONS; LABOUR UNIONS; RELIEF; SOCIAL SECURITY; STRIKES AND LOCK-OUTS; UNEMPLOYMENT; WAGES AND HOURS.

Mineral Products.—Statistical information on the mineral industry released by the Bureau of Mines of the U.S. Department of the Interior in 1939 pertained to the year 1938 (see also separate articles on minerals and metals). According to preliminary estimates, the total value of all mineral production in that year was \$4,354,000,000—a decrease of approximately 20% from the

Total Imports and Exports 1932-1939
(000 omitted)

Year	Export Total	% Increase	Import Total	% Increase
1932	\$1,611,016	..	\$1,322,774	..
1933	1,674,994	3.9	1,449,559	9.6
1934	2,132,800	26.5	1,655,055	14.2

* Except precious.

\$5,413,600,000 of 1937. In 1936 the value was \$4,556,800,000. Metals as a group suffered the greatest decline—about 40%—whereas the non-metals and mineral fuels each declined about 12%. Gold alone among the 10 principal minerals showed an increase in production. Production of pig iron and iron ore had the sharpest decrease, the latter metal dropping from \$207,828,213 in 1937 to \$74,322,405 in 1938. The leading mineral products of the U.S.A. in 1938, each with a total output value of more than \$100,000,000 were as follows:

Mineral	1938 value	1937 value
Petroleum	\$1,390,000,000	\$1,513,340,000
Bituminous coal	655,000,000	864,042,000
Natural gas	500,870,000	528,354,000
Pig iron	356,875,369	731,139,435
Coke	Not available	261,003,903
Pennsylvania anthracite	180,600,167	197,598,849
Gold	178,143,400	168,158,900
Cement	156,535,303	171,414,093
Stone	139,255,046	146,213,128
Copper (domestic ores only)	110,216,000	201,988,000

Finance and Banking.—Statistics pertaining to the United States will be found in separate articles such as BANKING; BONDS; BUDGET; FINANCIAL REVIEW; GOLD RESERVES AND GOLD STANDARD; GOVERNMENT EXPENDITURES; NATIONAL DEBTS; NATIONAL INCOME; STOCK EXCHANGES; STOCKS; TAXATION; WEALTH AND INCOME, DISTRIBUTION OF.

Defence.—Following Great Britain's and France's declaration of war against Germany, President Roosevelt on Sept. 8, 1939 declared a limited national emergency and ordered that all branches of the U.S. armed forces should be increased in strength. At the end of the fiscal year 1939, the actual strength of the U.S. Army by components was as follows:

	Commissioned Officers	Warrant Officers	Enlisted Men	Total
Regular Army	13,932	775	174,979	187,886
National Guard	14,455	211	184,825	199,491
Organized Reserve	116,719	..	3,054	119,773
Total, U. S. Army	144,206	986	361,958	507,150

All three components gained in numbers during the year, and the total net gain was 10,340 men. Expenditures of the U.S. War Department for the fiscal year ended June 30, 1939 were \$705,062,795. The U.S. Navy at the end of the fiscal year 1939 had 110,100 enlisted men and 6,877 line officers on the active list. The U.S. Marine Corps had an average enlisted strength of 17,500 men during the year. New enlistments in the Navy were 14,460 from 159,409 applications; re-enlistments were 80.81% as compared with 72.21% in 1938. Recorded expenditures of the Navy Department for the fiscal year 1939 were \$633,219,988.13; estimated expenditures for 1940, \$863,671,083.73.

The following is a summary of U.S. vessels, classified under the 1936 London Naval treaty, as of June 30, 1939:

	Number (including over-age)	Building or Appropriated for
Battleships	15	8
Aircraft carriers	5	2
Cruisers	34	9
Large mine layers	1
Destroyers	221	43
Submarines	89	25

The battleships under construction on July 1, 1939 were the "North Carolina," "Washington," "South Dakota," "Indiana," "Massachusetts," "Alabama," "Iowa" and "New Jersey." The numerical strength of the U.S. Navy at the end of 1939 is discussed in the article NAVIES OF THE WORLD. For additional data on the U.S. armed forces, see AIR FORCES; ARMIES OF THE WORLD; MARINE CORPS; NATIONAL GUARD.

United States Government Departments and Bureaus: see GOVERNMENT DEPARTMENTS AND BUREAUS. Also see under specific name, i.e. COAST GUARD, U.S., etc.

United States Housing Authority: see HOUSING; MUNICIPAL GOVERNMENT.

United States Mint: see COINAGE.

Universal Service: see ARMIES OF THE WORLD: Military Service.

Universities and Colleges. Continuous interest in higher education in the United States is shown by a steady growth in attendance, which is especially noticeable (1939) in the junior college and the graduate college. Five hundred seventy-five junior colleges, having enrolments totalling 196,710, were listed in 1939, as compared with 554, having 155,112 students in 1938. Enrolment in private junior colleges increased 20%; that of public junior colleges, about 30%. Distributed widely throughout the United States, junior colleges have had greatest development in the Middle and Far West and range in size from less than 100 students to from six to eight thousand. Thirty-two junior colleges enrolled more than 1,000 students each.

A recent statement by the American Association of Junior Colleges says: "Terminal education, at the junior college level, includes so-called 'general' education, designed to prepare students for social citizenship and for individual happiness, and semi-professional and perhaps other types of vocational education, designed to prepare students for economic independence."

Many colleges are considering new possibilities of improving the opportunities in general education within the framework of the four-year liberal arts college. This involves a more flexible program of college studies and a modification of the requirements for the bachelor's degree. Post-graduate registration for 1938-39 exceeded 90,000 students, a growth of more than 10,000 within two years. Notwithstanding the current increase in the demand for teachers with the M.A. or Ph.D. an over-supply is feared in many quarters. A few universities are taking definite steps ultimately to improve their methods of selecting students for graduate work. The fact that nearly 200,000 first- and second-year students now attend junior colleges accentuates the competitive aspects in the enrolments of the first two college years. On the other hand, thousands of junior college students enter conventional liberal arts colleges at the third-year level, especially in the Middle and Far West junior colleges.

The Engineers' Council for Professional Development completed an examination of facilities for teaching engineering in 140 engineering colleges. A voluntary committee of engineering professors not only evaluated the engineering colleges as a whole but specifically approved some three-fourths of their departments. Of the resulting report, Professor Dugald C. Jackson said: "The need is for better-sifted engineering students in the engineering schools and an increased proportion of technical-institute students looking forward to the engineering trades."

Medical education during 1939 has endeavoured to perfect plans for post-graduate medical education that will improve the clinical work of specialists in the various fields of medicine.

Colleges of dentistry are watching with interest the announcement from Harvard of a program in dental education in which new emphasis is to be placed on the biological and medical aspects of training in dentistry, leading to a degree in dental medicine rather than in dental surgery as heretofore.

The American Association of University Professors and the Association of American Colleges (presidents) have given much consideration to formulation of a more definite set of principles fundamental to appointment and tenure.

In 1939, the National Resources Committee, after an extensive study of research funds available in the United States, reported that, of the total of \$200,000,000 expended, \$50,000,000 was expended for research in the universities.

The individual differences of students, their needs and capacities, continued to attract the interest of administrators at every level. Conditions of admission and graduation were made more flexible. Hundreds of colleges participated in one or more of the experimental programs in testing and selecting students for the widest range of activities including general education, vocational education and research.

BIBLIOGRAPHY.—*Depression, Recovery and Higher Education*, a report by Committee Y of the American Association of University Professors. The draft of this report was prepared by Malcolm M. Willey, University of Minnesota (New York, 1937); *The Student and His Knowledge*, Bulletin No. 29 (Carnegie Foundation for the Advancement of Teaching, New York, 1938); *The Proceedings of the Institute for Administrative Officers of Higher Institutions* (1939). (W. A. J.)

Great Britain.—The crises of 1938 were not misunderstood by the universities of Great Britain. During the year preceding the outbreak of war preparations for the preservation of university life, teaching and research were under constant consideration. Evacuation of universities from vulnerable areas, reserved occupations, specialist assistance in war time by members of university staffs, commandeering of university buildings, military training, postponement of military service, the selection of officers in all branches of the defence forces, precautions against air raids, the conservation of research teams and emergency legislation were a few of the numerous questions discussed and settled before the beginning of hostilities. In Sept. 1939 the universities of Great Britain were ready for any contingency. That forecasts of possible happenings at the outbreak of war did not materialize, in no way detracted from the smooth working of evacuation and other schemes for the preservation of university teaching—a national necessity acknowledged and commended by Government. The university chiefly affected by the evacuation plans was the University of London, of which most of the larger colleges were hospitably received by institutions in neutral or non-vulnerable areas; but other universities have plans in readiness should occasion arise.

During the year up to the outbreak of war universities had been proceeding with their program of development. In September, uncompleted schemes had either to be curtailed or abandoned. The year 1939, however, is a fresh reminder that the university, if it is to achieve the results for which it has been established, must be a dynamic and not a static institution, must be a "museum for record, a laboratory for discovery and a powerhouse of inspiration." At Birmingham the Barber Institute of Fine Art was opened. A new gymnasium and physics block should be available early in 1940. At the University of Bristol the dental hospital was nearing completion and the new science wing was already in partial occupation. The Universities of Durham, Leeds and Liverpool report reorganization of courses. At the University of Manchester a physical education centre was opened—an indication, here as elsewhere, of a new outlook on the functions of a university in relation to its students. The University of Reading as a receiving centre had to discontinue work on new buildings to house the departments of zoology and psychology. The department of glass technology of the University of Sheffield has been housed in a new building. The University of Wales was empowered to establish a faculty of architecture and its colleges extended their facilities for physical culture. Similarly in Scotland the physical welfare of students was a deep concern of all the universities. At Aberdeen a new sports pavilion and swimming pool was constructed; at Edinburgh a university certificate of physical ability was instituted; and at St. Andrews alterations were made to the university gymnasium. At all, including Glasgow, where a new ob-

servatory was opened, and the universities of Ireland, additional teaching posts in a number of scientific subjects were created. (See also CAMBRIDGE UNIVERSITY; LONDON UNIVERSITY; OXFORD UNIVERSITY.)

Canada.—The universities of Canada report the establishment of new chairs and the creation of new posts. At Laval university extensive improvements were made to the school of medicine. At McMaster university a contingent of the Canadian O.T.C. was organized and a St. John Ambulance brigade formed for women students. The Government of Iceland made the University of Manitoba a depository for all books printed in Iceland.

Australasia.—At the University of Adelaide the Institute of Medical and Veterinary Science was completed. The Universities of Melbourne, Tasmania and Western Australia report the construction of new buildings and the addition of posts. At the University of Sydney a chair of aeronautics was established. At Victoria university college, New Zealand, a department of political science and public administration was created.

South Africa.—The universities and colleges in South Africa added to their facilities for the recreation, residence and physical training of students, as well as for the study of and research in South African problems.

India.—Most of the Indian universities report changes in regulations, additional courses and the creation of new posts. Universities in India, no less than those in other parts of the world, are also paying increasing attention to the physical welfare of their students. At two universities, Aligarh Muslim university and Nagpur, compulsory military drill has been introduced.

Europe.—The outbreak of war in Sept. 1939 at once disorganized university teaching in many of the countries on the continent of Europe. In Germany the number of university teaching centres was reduced to six and university standards were lowered. In Poland the Universities of Warsaw and Cracow ceased to function as centres of Polish culture. In what was Czechoslovakia students were massacred. In Finland the University of Helsinki was partially destroyed by bombing. From Russia no report has been forthcoming. In Belgium the most important developments reported are from the University of Liège where a school of criminology was created. Reciprocal postgraduate scholarships were arranged with British universities. Similar arrangements were made between British and French universities. In Bulgaria public funds were made available for poor students. In Denmark, in the Universities of Copenhagen and Aarhus additions were made to the teaching staffs in theology, medicine, sociology and comparative literature. The Italian Government increased the number of scholarships on a reciprocal basis to students of other countries. A chair of aerology was established in the University of Rome. At the University of Vytautas the Great in Lithuania large clinics were completed and equipped. In Spain, with a record number of matriculated students, the University of Madrid was reopened. By the removal of the ban on teaching by members of religious orders a large increase in the number of women students was recorded. In Turkey the number of students at the University of Istanbul has now risen to 7,135. Facilities for study and research have been greatly extended.

South America.—In the Argentine a new national university was founded at Cuyo to give special attention to the study of modern languages and to English in particular. In Peru a chair of English was established in the Universidad Mayor de San Marcos.

The following seven pages carry a selected list of universities and colleges in the U.S. and Canada, with location, year founded, chief executive, enrolment, size of faculty, endowment and number of library volumes, for the academic year 1939-40. An asterisk denotes 1938-39 data.

Uranium. Closely associated with radium, Canada and Belgian Congo are the chief sources of uranium. In 1937, Canada produced 212,000lb. of uranium salts from the treatment of 290 short tons of ore. Exports of uranium ore from Belgian Congo are irregular, being none in 1938 and 1,052 metric tons in 1937; the average during the past several years has been about 400 tons; exports of uranium salts from Belgium, where the ore is treated, have been increasing, and reached 150 tons in 1936. The uranium content of ores produced in the United States in 1938 was only 51,705lb., while imports of uranium oxide and other salts during the year totalled 376,708 pounds. The chief use is as a colouring agent in ceramics and glass, there being little use for the metal itself. (G. A. Ro.)

Urology. Probably the most important recent advance in the field of urology has been in chemotherapy. In no field of medicine has the value of international co-operation been better exemplified than in the development and clinical application of such important chemotherapeutic agents as mandelic acid, the hydrochloride of 2:4-di-amino-azobenzene-4-sulphonamide (prontosil), para-amino benzene sulphonamide (sulphanilamide) and sulphapyridine. This group of drugs has revolutionized the treatment of infections of the genito-urinary tract. Sulphanilamide and sulphapyridine are the most valuable agents yet discovered for the treatment of gonorrhoea. Recent reports would indicate that sulphapyridine is more effective than sulphanilamide in the treatment of this disease. Sulphanilamide and neoprontosil, however, are superior in the treatment of other types of infection in the urinary tract. Sulphanilamide and prontosil have been found to be more efficacious in the treatment of bacillary than coccic infections, but, like mandelic acid, the effectiveness of sulphanilamide and prontosil is reduced in the presence of complicating factors such as stone and hydronephrosis. Mandelic acid is also widely employed in the treatment of uncomplicated bacilluria and is usually attended by less systemic reaction than that which results from the use of sulphanilamide. An appreciation of the toxic manifestations of these drugs makes it imperative that they be administered under the close supervision of a physician. In the selection of these drugs it has been found necessary to pay close attention to bacteriologic factors involved in the infected urine. Additional studies of the normal bacterial flora of the urethra and bladder, together with improved media for the culturing of pathogenic bacteria and detection of urea-splitting organisms, are a definite contribution. During recent years the recognition of gonococcal infection by means of cultures has been generally employed.

Although the fundamental causes of calculous formation in the urinary tract are still unsolved, important pathologic and bacteriologic studies have been reported in recent years which throw some light on causative factors. The importance of infection in some instances of formation of calculi, particularly in the presence of such urea-splitting organisms as the staphylococcus and proteus, would seem to be more clearly established than was formerly the case. Attention has been called to the frequent occurrence of "milk patches" in the renal papillae, which apparently constitute a nucleus for development of calculus. Continued effort to prevent the re-formation of urinary calculi following surgical removal by diet, vitamin A therapy and acidification seems justified, although no definite value has as yet been shown for such treatment as a substitute for surgical intervention.

There has been an increasing degree of appreciation of excretory urography as a diagnostic procedure, with the use of serial, angulated, respiratory and postural urograms.

In the field of surgery, continued and more extensive use of transurethral prostatic resection has emphasized the value of this procedure in the hands of the skilled surgeon. The excellent functional results and the associated low mortality and morbidity rate reported by a skilful few indicate this to be more and more the procedure of choice in the treatment of the enlarged prostate gland. Transurethral resection is also being employed more often than heretofore in removing small amounts of prostatic and sphincteric tissue which has been causing urinary retention, this type of retention having been regarded previously as being of neurogenous origin.

The operation of ureterosigmoidostomy, or the transplantation of the ureters into the sigmoidal portion of the colon for the diversion of the urinary stream, has been accepted as the procedure of choice in instances of exstrophy of the bladder, irreparable vesicovaginal fistulas and intractable cystitis, as well as in selected instances of carcinoma of the bladder. Simultaneous transplantation of both ureters, followed by total cystectomy after a period of a few weeks, is now regarded as the best method of relieving patients who have extensive carcinoma of the bladder.

The attention of the urologist has been called to the important association of unilateral renal disease and hypertension by recent experimental observations with ischemia produced by partial compression of the renal arteries. This work has revived the theory which associated hypertension with renal disease. Case reports indicating clinical application of the results of these experiments have appeared in recent medical literature. Nephrectomy for unilateral renal disease caused by chronic infection and for congenital malposition of the kidney with partial occlusion of the renal vein, has been followed by disappearance of hypertension. Attention of the urologist is called to the wisdom of careful investigation of the kidney itself before subjecting the patient to extensive sympathectomy and operations on the adrenal body for malignant hypertension. On the other hand, careful post-operative clinical investigation will be necessary to prove that nephrectomy has been the chief factor in a permanent reduction of the blood pressure of a patient who previously had hypertension.

The use of intravenous anaesthesia for urologic procedures of short duration is a definite contribution, and the continued use of spinal anaesthesia in limited extents has gained the method a permanent place in this field.

Advances in the use of endocrinologic substances in the treatment of various lesions in the genito-urinary tract are still in the experimental stage, although there is definitely increased interest in this field. There has been much closer co-operation between the biochemist and the urologist than has been the case before. Much experimental and some clinical use of the male and female sex hormones has been reported. The use of these hormones in the treatment of prostatic hypertrophy has thus far been disappointing, in spite of a few encouraging reports. Continued use of the anterior-pituitary-like gonad-stimulating substance of the urine of pregnancy in the treatment of undescended testes is useful, although such a procedure is not unattended with dangers. It is probably most useful during or prior to the age of puberty when, even though surgical intervention may be necessary, use of the substance will make the operation easier for the surgeon. The female sex hormone (oestrin) is of value in the treatment of vulvovaginitis in children. (See also CHEMOTHERAPY.)

Uruguay, a republic on the Atlantic coast of South America, between Brazil and Argentina; language, Spanish; president, General Alfredo Baldomir; area, 72,153 square miles. Population (1933 census): 1,993,234; official estimate (1939), 2,132,888. The percentage of whites in the population is greater than in any American country except Argentina and Canada. The chief cities are: Montevideo, 684,036; Paysandú, 40,000; Salto, 30,000; Mercedes, 23,000; Colonia, 12,000.

History.—Politically, Uruguay was quiet and stable during 1939, with indications of a gradual return to the full exercise of democracy which had characterized the country during the quarter-century preceding 1930. The country was still faced with economic difficulties, but the outbreak of the European war in Sept. 1939 had a generally (although not entirely) favourable effect, due especially to the increased sale of livestock products. To provide subsidies for adversely affected industries, a 25% tax was imposed on war-time profits of the pastoral industry. Meanwhile, wool sales increased, and, in November, the British Government purchased £862,938 value of British beef. Acreage for the 1939-40 season was higher for all crops except wheat and birdseed. In the last months of the year, a reciprocal trade agreement with the United States was in process of negotiation, but observers were pessimistic as to the outcome.

Uruguay participated in the Panama Conference, and was a leader in the expulsion of Russia from the League of Nations in December. On December 13, the German pocket-battleship "Admiral Graf Spee" engaged in battle with three British cruisers off the Uruguayan coast and fled to Montevideo in a crippled condition. German demands for time for repairs were rejected and the "Spee's" internment was ordered unless she departed by December 17. When the vessel left Montevideo, its crew scuttled it in sight of Montevideo. On December 30, the German merchantman "Tacoma," auxiliary to the "Spee," was given 48 hours to leave or be interned, and was interned Jan. 1, 1940.

Education.—Education is free and compulsory. There are nearly 2,000 elementary and secondary schools, with more than 200,000 pupils. The National university at Montevideo, with 10,000 students, ranks high. In 1937, 87.64% of all education was borne by the State. Montevideo is one of South America's leading cultural centres.

Finance.—The monetary unit is the peso, valued at 38 cents U.S. (Dec. 1939). The public debt was 350,171,000 pesos in 1938.

Communications.—External communication is largely by water, with railway, highway and air transport assuming greater importance, however. There are approximately 22,487 mi. of highways of all classes, and 1,650 mi. of railways (of which 90% is under British control and ownership). Regular and frequent communication by air is maintained with Buenos Aires and with Brazil.

Foreign Trade.—Livestock products comprise 85% of all exports. Wool alone totals over 45%. Agricultural products, almost entirely cereals, aggregate 10%. In 1938 imports were 74,394,730 pesos, exports, 96,355,248 pesos. Great Britain held first place in each, with 19.8% and 26.1% respectively; Germany, formerly third, supplanted the United States in second place, increasing her sales to Uruguay by 46%, and her purchases by 73.3%, bringing her share of the imports and exports to 16.8% and 23.5%, respectively. Imports from the United States declined 18%, and aggregated 12% of the total, while United States purchases fell 72.4% to form only 4% of all exports. Imports are chiefly machinery, textiles and clothing, and foodstuffs and beverages. Exports normally exceed imports, but public debt service, dividends and other foreign capital payments usually more than offset. In the first half of 1939, imports and exports were respectively 54,528,000 pesos and 30,055,000 pesos, with the United States rank-

ing sixth in total trade.

Production.—Cattle-breeding and sheep-raising are the chief industries, and nearly 80% of the land is devoted to grazing. Processing and packing of meat products is an important industry. Wheat, linseed, maize, oats, potatoes are the chief agricultural products. (See HISPANIC AMERICA AND THE EUROPEAN WAR.)

(L. W. BE.)

U.S.S.R.: see UNION OF SOVIET SOCIALIST REPUBLICS.

Utah, a Rocky Mountain State, admitted to the United States in 1896, is popularly known as the "Mormon State"; area, 84,990 sq. mi.; population in 1930, 507,847; in 1939, 520,000 (estimated). In 1930 there were 495,955 native whites, 1,108 Negroes, and 10,784 persons of other races, including 4,012 Mexicans, 3,269 Japanese, and 158 Filipinos. Salt Lake City, the capital, had a population of 140,267 in 1930 and 149,000 (estimated) in 1939. Other cities: Ogden, railway centre (1930), 40,272; Provo, seat of Brigham Young university (1930), 14,766; Logan, 10,061.

History.—Mormon population of the capital is estimated at 40% and that of the rural districts at 60%. In recent years the Mormon social security program has attracted national interest.

With 21 Democrats and 2 Republicans in the Senate, and 45 Democrats and 15 Republicans in the House, the legislature followed a conservative course, rejecting homestead tax exemption and revamping old-age pension laws so that aid will be based upon age and need rather than age alone. An act to exempt personal property from taxation up to \$300 was passed, but legislation in the direction of trade barriers, including a chain store tax proposal, was defeated.

Efforts to prohibit married women from receiving public employment resulted only in the adoption of a resolution urging State agencies to spread work as much as possible. Other laws provided for a Fair Trade Practices Act for agriculture by which farmers hope to stabilize farm products prices, the relief of business from the average monthly inventory tax by substituting a year-end inventory tax, the control of small-loan agencies by the State banking department, and extension of the eight-hour day for women to all occupations. Governor: Henry H. Blood.

E. E. Monson was secretary of State; John W. Guy, auditor; Reese M. Reese, treasurer; Joseph Chez, attorney-general; and Charles H. Skidmore, superintendent of public instruction.

Education.—The University of Utah, Salt Lake City, has an enrolment of 4,334, the Utah State agricultural college, Logan, 3,229, and Brigham Young university 2,782. With an enrolment of 138,047 students and a force of 4,631 teachers and principals and 1,000 other employees, the cost of elementary education was as follows: operating cost, \$9,557,100.47; capital outlay and debt service, \$12,908,713.21. High school diplomas were granted to 7,948.

Agriculture, Manufacturing, Mining.—Mining and agriculture are the State's chief industries. With each of the five principal non-ferrous metals showing an increased value in total output, metal mines in 1939 produced gold, silver, copper, lead and zinc valued at \$62,385,575, a gain of 43% over 1938. Nearly 77% of the total increase was in copper alone.

Manufactured products had an estimated value of more than \$200,000,000, of which mining machinery, shipped to various parts of the world, accounted for \$2,500,000.

Oil refining, now in its third decade, has become a major industry. During 1939 a 442-mi. pipeline was built to carry crude oil from Wyoming fields to Utah refineries.

Utah produced more than \$11,000,000 worth of sugar beets, and increased activity was noted in the cement and plaster making in-

dustry, meat packing, brewing, and canning of fruit, vegetables, and milk.
(F. W. GA.)

Vaccination: see SERUM THERAPY.

Valdemar (1858–1939), Prince of Denmark, was born at Bernstorff on October 27, the youngest son of Prince Christian of Gluecksburg, later King Christian IX of Denmark. He was the brother of Alexandra, queen consort of King Edward VII. Valdemar married Princess Marie of Orleans in 1885 and of this marriage one daughter, Princess Marguerite, and four sons were born. All the latter except Prince Axel married commoners and renounced their royal rights. Before the World War Valdemar was known as the “uncle of kings,” his nephews then being rulers of Great Britain, Denmark, Greece, Norway, and Russia. He himself declined two thrones—those of Bulgaria and Albania. After his retirement as admiral of the Royal Danish Navy, he helped manage the East Asia Ocean Steamship Line, of which he was a large stockholder.

Prince Valdemar died at Copenhagen on January 14 and was buried in Roskilde cathedral.

Vanadium. Required as a constituent in certain types of high grade alloy steels and cast irons, vanadium is produced in considerable quantities. World production in 1938 was about 3,150 metric tons, of which Peru furnished 47%, United States 25%, South West Africa 16%, and Northern Rhodesia 12%, with small amounts from other sources. There is a growing demand for vanadium catalysts in the production of sulphuric acid and certain organic compounds, as well as in the ceramic and dyeing industries.

(See also RADIUM.)

(G. A. Ro.)

Vandenberg, Arthur Hendrick (1884–), U.S. Senator, was born at Grand Rapids, Mich., on March 22. After graduating from high school he studied for a year at the law school of the University of Michigan but did not complete his course. Instead he began work in 1902 as a political reporter for *The Grand Rapids* (Mich.) *Herald*. Four years later he became editor of this newspaper. His first important political job was as a member of the Republican State Central Committee (1912–18); he was also chairman of the Republican State convention in 1916 and 1928. He resigned his editorship of the *Herald* in 1928 upon his appointment to the U.S. Senate to fill a vacancy, and in November of that year he was elected as a Republican for the regular term. Re-elected in 1934, he was probably as responsible as any other man for preventing the total disruption of the Republican Party in the upper house. His political tactics consisted of building a coalition between members of his party and anti-Administration Democrats. The first major victory of this bloc was the defeat of Roosevelt's Supreme Court bill in 1937, but it also scored such notable minor victories as defeat of appropriations for the Florida Ship canal and Passamaquoddy bay, and by 1939 it was a powerful opponent to almost all legislative programs of the New Deal. With Borah (Rep., Ida.), Nye (Rep., N.D.) and Johnson (Rep., Calif.), Vandenberg in Sept. 1939 became the chief opponent of repeal of the arms embargo in the U.S. Neutrality act. Vandenberg was prominently mentioned in 1936 as a presidential possibility and is a leading candidate for the Republican nomination in 1940, having declared on May 29, 1939, that he would accept it. He is author of two books on Alexander Hamilton and of *The Trail of a Tradition* (1925).

Van Dine, S. S. (WILLARD HUNTINGTON WRIGHT) (1888–1939), U.S. author, creator of the detective character Philo Vance, was born in Charlottesville, Virginia. He was educated at St. Vincent and Pomona colleges in California, and at Munich, Paris, Cambridge, and Harvard. From 1907 to 1913 he was on the staff of *The Los Angeles Times* as music critic and literary editor; from 1912 to 1914 he was editor of *Smart Set*. Later he was critic and editor on the staffs of *The Forum*, *The New York Evening Mail*, *The San Francisco Bulletin* and other publications. Meanwhile he had completed nine serious volumes on art, literature, and philosophy, and had published several music compositions. Overwork caused a nervous breakdown in 1923 and he was in bed for two years. To pass the time he read detective stories, and in 1926 he started writing his own fiction. First of the “Philo Vance” books to appear was *The Benson Murder Case*, followed by *The “Canary” Murder Case* and *The Greene Murder Case*, all written under the pseudonym of Van Dine. These were popular successes and Philo Vance, though deprecated by his creator as quite an ordinary character, found his way into motion pictures. Van Dine died at New York city April 11.

Varnishes: see PAINTS AND VARNISHES.

Vassar College, Poughkeepsie, New York, entered upon its 75th year of instruction in Sept. 1939, having been founded in 1861 and opened in 1865. In the academic year 1939–40, a three-year interdepartmental major field in primitive cultures was established, under the administration of the newly created Division of Anthropology, offering courses in the biological basis of race, European and American archaeology, primitive languages, social organization and religion, and with opportunities for concentrated study in physical anthropology, cultural anthropology or archaeology. Through a five-year grant from the Carnegie Corporation, a program of summer field work in the archaeology of the American Indian in the Hudson River valley was inaugurated under the direction of Dr. Mary Butler.

From the Works Projects Administration the college received a loan collection of the complete records of the Federal Theatre. From the Rockefeller Foundation it received a grant for theatre research based on these records to be supervised by Mrs. Hallie Flanagan, professor of drama and director of the Experimental Theatre at Vassar and former national director of the Federal Theatre. This research will cover preparation of a report summarizing the four years' work of the Federal Theatre, publication of special bulletins describing new techniques in design and production introduced by it, completion of various pieces of theatre research begun by it and indexing of Federal Theatre records.

Students and faculty raised two full scholarships for refugee students, one of which was awarded to a girl from Germany and the other to one from Italy. A third refugee scholarship given anonymously by two alumnae was awarded to a student from Austria. Through a faculty committee a program was put into effect of bringing to the college a succession of displaced European scholars for a fortnight each as visiting lecturers. (H. N. MacC.)

Vatican City State. The Vatican City State, established in 1929 as a sovereign and independent State by the Lateran Treaty between the Holy See and Italy. The total area is 108.7ac., adjacent to Rome, and completely encircled by Italian territory. Within its confines are the basilica of St. Peter, the papal palace, the Vatican library, museums and gardens, together with several smaller edifices. Thirteen buildings in Rome and the papal villa at Castel Gandolfo are recognized parts of the Vatican, and enjoy extra-territorial rights. The population is 1,006.

The Vatican City State constitutes the temporal domain of the papacy. Over it, the pope exercises complete legislative, executive and juridical rights. Administrative matters are in charge of a commission of three cardinals, according to a decree issued by Pius XII in March 1939, and under a layman, as governor. The territory is policed by the papal gendarmes, consisting of about 100 men, and by the famous Swiss, Noble and Palatine guards, mostly decorative. Being a sovereign State it has its own flag, its own coinage and postal service, its own independent press and radio station, enjoys diplomatic immunity and receives representatives from foreign nations. The official publication is the *Acta Apostolicae Sedis*, with a circulation of some 10,000. The *Osservatore Romano*, a semi-official newspaper, with a normal circulation of about 50,000, has increased, since the European war, to 200,000.

The Government of the universal Catholic Church is centred in the Vatican. Here the pope exercises temporal and supreme spiritual power. Here are located the Congregations governing religious matters. Here are received the bishops and ecclesiastical dignitaries from everywhere. Here are accredited ambassadors and ministers from foreign nations, and from here are appointed, by the dual spiritual and temporal powers, papal representatives to the nations. (See ROMAN CATHOLIC CHURCH: *Spiritual and Temporal Relations*.)

As an independent State, and as a spiritual and moral force, the Vatican strove to preserve European peace, and dealt diplomatically with the nations involved. In conflict, as in Russia and Germany, it championed the rights of religion and of its spiritual subjects. With other nations, it aspired to promote friendly relations and to regulate the status of Catholic citizens and subjects. (See also PRUS XII.) (F. X. T.)

Vegetable Oils and Animal Fats.

Domestic fats and oils in the United States in Sept. 1939 rose from the lowest price level in five years, because of speculative movements and economic developments attendant on the advent of war. Oleo oil and oleostearine advanced about 50%, and cottonseed oil, lard, grease, sardine oil, tallow and corn oil about 30%. Of the drying oils, tung and oiticica oils advanced 80% to 100%; linseed about 12%. Teased oil, like tung oil, affected by the war in China, advanced 60%. Lard, cottonseed, coco-nut and corn oils declined after the first weeks of war, but oleo, olive, peanut and linseed oils remained fairly steady. The largest production of oils and fats from domestic materials in the United States was estimated for 1939, about 8,500,000,000lb. against 8,000,000,000lb. in 1938 and a five-year average of 7,753,000,000 pounds. World production in 1939 was also estimated as the largest on record, although figures from many countries were not available. On the outbreak of war the Food Ministry of Great Britain requisitioned all fats and oils in the United Kingdom and also all stocks of oils, oilseeds and fats of more than 50 tons held outside the United Kingdom by nationals. Trade was put under a licensing system. Denmark and the Netherlands prohibited exports of most fats and oils. Norway placed oils and fats under the same Government control as oleomargarine.

An amendment to the Philippine Islands Independence Act,

signed by the President Aug. 7, 1939, specified that no export tax would be placed on copra and coco-nut oil shipped to the United States and that beginning with 1940, 440,000,000lb. of Philippine oil would be admitted duty free by the United States, this amount to decrease annually by 5% up to 1946 and then by 3% up to July 4, 1946, the date of Philippine independence. After that the same U.S. tariffs as against other nations would apply. (S. O. R.)

Vegetables: see CORN; LETTUCE; POTATOES; SWEET POTATOES; TOMATOES; TRUCK FARMING; ETC.

Venereal Diseases.

Stimulation of venereal disease control work throughout the United States has been accomplished to a great extent by direct grants-in-aid to the States from the Federal Government through the Public Health Service. During the fiscal year ended June 30, 1939, \$3,000,000 was appropriated by the Congress for the control of venereal diseases. Health departments in the 48 States and in many localities made available an additional sum totalling more than \$4,300,000 for the control of syphilis and gonorrhoea. In developing the national program, each State health department is responsible individually for the character and extent of the measures adopted. This permits the development of a campaign in each State which meets local social and economic conditions.

Generally speaking, the principles most frequently followed are: (1) organization, within the State or large municipal health department of an administrative unit charged with the direction of the program—this unit to be directed by a properly qualified full-time venereal disease control officer. At present 31 States have such medical officers.

(2) One of the great present needs is to strengthen the methods for obtaining reliable case reports of patients infected with syphilis and gonorrhoea in the hope of establishing a trend. This phase of the program is being given special study in 16 States. The Public Health Service has aided the State health departments in the introduction of the most modern mechanical statistical methods for collecting and tallying case reports.

(3) The development of sufficient facilities for the adequate treatment of medically indigent patients is a fundamental need for syphilis control. Clinics are important—particularly in urban areas, and should be organized and operated along the most effective lines. Today there are available more than 2,200 clinics for the treatment of syphilis and gonorrhoea, as contrasted with 1,000 in 1936. In rural areas where clinics are not feasible, a satisfactory plan has been adopted which includes the utilization of the services of physicians in private practice. Some State health departments subsidize these physicians for the treatment of indigent persons. In all States the health department distributes anti-syphilitic drugs free to physicians for the treatment of indigent patients. In 1935 a total of 6,500,000 doses of arsenical drugs used in the treatment of syphilis was sold in the United States; in 1938, 10,500,000 doses were sold.

(4) The principle that early diagnosis is essential for the control of syphilis is as true as for any other communicable disease. Darkfield microscopic examinations are now available in many of the venereal disease clinics. Most State health laboratories perform such examinations upon request.

A few years ago, only the effectiveness of the serologic tests for syphilis as performed by the originators of the tests was known. The Public Health Service has in recent years conducted annually studies of the efficiency of performance of serologic tests for syphilis in State laboratories. Encouragement is also being given to similar studies of tests performed in municipal and private laboratories within the States under the jurisdiction of the health department. The information available at present shows that the

Production of Principal Oils and Fats in U. S., 1938 and 1939
(Estimated by the Department of Agriculture)

	1939 lb.	1938 lb.		1939 lb.	1938 lb.
Butter . .	2,300,000,000	2,297,000,000	Oleo Oil .	70,000,000	6,000,000
Lard . . .	2,100,000,000	1,754,000,000	Oleostearine	40,000,000	49,000,000
Cottonseed Oil . . .	1,350,000,000	1,678,000,000	Fish Oils .	200,000,000	188,800,000
Soybean Oil	500,000,000	323,000,000	Tallow (inedible)	900,000,000	762,000,000
Corn Oil .	145,000,000	137,000,000	Linseed .	250,000,000	157,000,000

quality of serologic test performance in State laboratories is from 200% to 300% improved over that of three years ago. In the fiscal year 1939 a total of 5,500,000 serologic tests for syphilis was performed, as contrasted with 2,000,000 in 1936.

(5) Before facilities for treatment were increased to meet more nearly the needs, it was estimated that only half of the people infected with syphilis sought treatment during the early stage. The number infected and failing to seek treatment immediately is still large, but progress has been made through case-finding methods. Most local health departments make provision for proper contact-tracing in early syphilis and the number of people brought under treatment through this means is steadily increasing.

The principle of applying serologic tests to discover syphilis in large population groups is being employed extensively just as laboratory methods have been used to find patients with other communicable diseases. This method of case-finding is employed wherever the prevalence rate for syphilis in the group to be surveyed is believed to exceed the average prevalence rate for the U.S. as a whole.

(6) A special application of the survey of population groups is the employment of serologic tests in premarital and prenatal physical examinations. During 1939 laws requiring blood tests for syphilis before marriage were enacted in 12 States. This increases to 19 the number of States that have such laws. These laws vary to some extent, and it is possible that some may require amendment in the future. All, however, provide for the performance of a serologic blood test for syphilis on both applicants for a licence to marry—the test being part of a physical examination. In most States these laws are waived when there seems to be no danger of transmitting syphilis in marriage, or when the marriage is in the interests of the public welfare. Another important law enacted in 15 States during 1939 has been that which requires that a blood test for syphilis be done on every pregnant woman. Seventeen States in all now have such laws.

(7) Health departments and unofficial agencies continue to cooperate in the national educational program. The press, radio, moving pictures, printed material, and lectures all have their field of usefulness. Generally speaking, the aim of the educational program is to inform the people about the prevalence of syphilis and gonorrhoea, the possibility of preventing infection, the services required should the individual become infected, and the need for Governmental action in providing medical services for indigent patients. (See also CHEMOTHERAPY; PUBLIC HEALTH SERVICES.)

Venezuela, a federal republic in Northern South America; language, Spanish; capital, Caracas; president, Eleazar López Contreras. The area is 393,976 sq.mi.; the population by the 1936 census was 3,467,839, including 103,492 Indians. The principal cities, with their populations, are: Caracas, 203,432; Maracaibo, 110,010; Valencia, 49,214; Barquisimeto, 36,429; Nirgua, 30,706; Carúpano, 30,163; Maracay, 29,759; Rio Caribe, 29,696; Boconó, 25,315; Ciudad Bolívar, 25,134; Puerto Cabello, 22,213; San Cristóbal, 21,874; Cabimas, 21,753; Cumaná, 21,623; La Victoria, 21,372. La Guaira, the port of Caracas, has a population of 9,717.

History.—Under the "Three-Year Plan" inaugurated in 1938, Venezuela continued economically prosperous and politically stable throughout 1939. A contract involving expenditure of 22,479,235 bolívares (nearly \$7,000,000) for new docks and other harbour improvement at La Guaira was made with a Netherlands firm; steps were taken for the modernization of Caracas, and encouragement given to immigration. Important new legislation in-

cluded a petroleum law regulating concessions, an act for the inspection and supervision of insurance companies, and another providing for free legal counsel for workmen. The compulsory profit-sharing law, enacted in 1937, was put into effect early in the year. Bonuses to employees ran as high as 12.45% in some cases. In November, a catastrophic fire completely destroyed the oil town of Lagunillas (pop. 13,922), on Lake Maracaibo, with heavy loss of life and huge property damage.

Venezuela's international relations were featured by cordiality with the United States. Reciprocal exchange of ambassadors (instead of ministers, as formerly) was effected early in 1939. On November 6, a reciprocal trade agreement (effective Dec. 16, 1939) between the two countries was signed. Under it, Venezuela reduced duties on important importations from the United States, while that country halved her tariff on Venezuela petroleum, although limiting importation through a quota system.

Education.—Primary education is compulsory and under Federal control. Considerable advance was made during 1939 in education. In 1938 there were 4,142 primary schools, with 231,554 pupils; 11 normal schools, with 692; and 51 secondary schools with 3,497 students (in addition to those in 24 private secondary schools). Two universities and the geological institute had a combined enrolment of 2,166 in 1939.

Trade and Communication.—Venezuela has extensive steamship communications (under normal conditions), and adequate external air communication. There are 993km. of railways, and a relatively good highway system. The principal highways aggregate 2,761km. in length. In the Orinoco valley transportation is almost entirely fluvial.

In 1938 there were 21,880 telephone stations in service, a gain of 12% over 1937 and more than 36% over 1936. Telegraph traffic in 1938 was over 30% greater than in 1935.

Imports totalled 311,871,006 bolívares in 1938 (United States, 56.2%; Germany, 11.9%; Great Britain, 7%), a slight increase. Machinery, electrical apparatus, and similar commodities aggregated 23% of all imports, textiles 22%, foodstuffs and beverages, 16%. Exports were 888,240,443 bolívares, of which 93.2% were in petroleum products, with coffee, gold, and cacao also important. Some 72% of all exports went to Curaçao in 1938, 13.7% to the United States.

Production.—Venezuela is the third largest petroleum producer in the world, with a 1938 output of 28,071,371 metric tons, almost 10% of the world's total, and the highest Venezuelan production in history. Practically all the petroleum is exported. Taxes derived from it furnish around a third of the national revenue. The chief agricultural product is coffee, with cacao second.

Finance.—The monetary unit is the bolivar (value: \$.31 U.S.). The national debt is approximately 3,000,000 bolívares, all internal, and is probably the lowest per capita of any country in the world. The budget for 1939 called for 335,261,000 bolívares.

BIBLIOGRAPHY.—E. Fergusson, *Venezuela* (New York, 1939). (L. W. BE.; R. W. H.)

Vermiculite. Its utilization for house insulation has led to a marked increase in the production of vermiculite, a type of mica which expands enormously when heated, thus giving a cellular structure with a large amount of air space. United States production was 20,700 short tons in 1938, a decrease of about 22% from 1937, some of which is exported to Great Britain and continental Europe. Following the successful application in the American market, attempts have been made to exploit deposits in the Soviet Union and South Africa. The chief producing centres in the United States are Montana, Colorado and Wyoming, which makes freight charges a big factor in Eastern consumption.

A two-inch layer of expanded vermiculite is reported to reduce attic heat loss by 75%, and a four-inch layer by 92%.

(G. A. Ro.)

Vermont, fourteenth State of the United States, first to be added to original thirteen, popularly known as the "Green Mountain State"; area, 9,564 sq.mi.; population according to the U.S. census of 1930, 359,611, with slight increase since, both urban and rural. Capital, Montpelier, 8,000. Largest city, Burlington, 26,000. Of the State's population 118,766 are urban, or 30%; 358,965 whites; 568 coloured; 315,904 native-born; 43,061 foreign-born.

History.—During 1939 the milk price situation continued to occupy the attention of the extensive dairy interests of the State. A new milk inspection and licensing law covering retail milk dealers and a new Bang's disease control law came into effect. Rural areas paid more in motor vehicle registration fees, motor fuel taxes and other motor vehicle imposts than urban areas. Motor vehicle inspectors travelled 911,038 miles in State cars at a cost of \$28,517. Motor coach travel service, developing the State as a playground, increased. It is predicted that Vermont's sub-marginal land problem will be reduced to a minimum in the next decade if the present trend of high class summer home development continues. State air service has been materially expanded during the year. The governor was George D. Aiken; William H. Wills, lieutenant-governor; Rawson C. Myrick, secretary; Thomas H. Cave, treasurer.

Education.—The public school system of the State is under the supervision of a State commissioner of education and local union superintendents, the revenues being derived mainly from State and local taxes. A plan for equalization of educational opportunity is being worked out. Vocational training is at present confined largely to agriculture and home economics. School buildings and equipment are being improved and teacher courses and requirements strengthened. There are six colleges and universities, three junior colleges, two State normal schools and a State agricultural school.

Charities and Correction.—The charitable and corrective institutions consist of a State prison and women's reformatory, industrial school, two hospitals for the insane, a school for feeble-minded and a home for children. The public welfare department has new appropriations of \$5,000 a year for 1940 and 1941 to aid adult crippled and \$10,000 for a psychiatric clinic division.

Finances.—The State Treasury reported a balanced budget at the end of the fiscal year ending June 30, 1939. State financial officers have begun issuing reports giving a more accurate picture of State resources. Old age assistance gets the largest increase in appropriations during the next two fiscal years. The State tax department reported a decrease of \$815,530.10 in the appraisal valuation of real estate and a drop of \$14,334.15 in the total general property grand list of the State. The reduction was due largely to property losses incurred in the 1938 hurricane. WPA expenditures were \$3,046,782.02 in Federal funds and \$1,112,082.86 by State and local units. Banks report a decrease in loans on farm lands, a heavy gain in holdings of U.S. Government obligations and a reduction in real estate owned by them. Stabilization of bank deposits is indicated by the smallest decline in deposits in the last ten years.

Industries.—Industries, including mining, have been reasonably steady in their output and employment during 1939. Such industrial growth as the State is experiencing is coming for the most part from within through the development of its own natural resources. Indications are that chemical research as applied to agricultural production may play an important part in this trend.

(L. W. D.)

Veterans' Administration. The following summation shows the number of veterans and deceased veterans whose dependents were receiving pension or compensation benefits as of June 30, 1939:

War	Living Veterans	Deceased Veterans	Total
War of 1812		I	I
Mexican		168	168
Indian	2,525	4,251	6,776
Civil	3,516	57,915	61,431
Spanish-American			
Service connected	1,686	1,483	3,169
Non-service connected	163,912	54,339	218,251
Special acts	112	60	172
Total Spanish-American	165,710	55,882	221,592
World War (War Time)			
Service connected	342,072	99,822	441,894
Non-service connected	52,936	12,220	65,156
Total World War	395,008	112,042	507,050
Regular establishment	34,185	9,415	43,600
Grand total	600,944	239,674	840,618

Insurance.—As of June 30, 1939, benefits provided for under Term and Automatic Insurance were being paid in monthly installments to 11,134 permanently and totally disabled veterans and to the beneficiaries of 19,097 deceased veterans. The disbursements for the above benefits during the fiscal year 1939 approximated \$38,393,938.70.

As of June 30, 1939, there were 605,716 United States Government life insurance policies in force, having a face value of \$2,561,712,315.

As of the above date monthly payments were being made, from the United States Government life insurance fund, to 10,495 permanently and totally disabled veterans.

Emergency Officers' Retirement Pay.—As of June 30, 1939, there were 1,813 emergency officers receiving retirement pay for disabilities incurred during the World War. The annual disbursement for this form of benefit during the fiscal year 1939 approximated \$2,991,326.30.

Guardianship.—The Veterans' Administration, in order to safeguard all monies paid by the Government in the form of pensions and compensation to incompetent or minor beneficiaries, maintains a close supervision of all guardianship activities.

The following summation shows the number of fiduciaries under supervision as of June 30, 1939, subdivided by types of beneficiaries:

	Incompetents		Minors	Total
	Veterans	Others		
Fiduciaries acting for wards of all wars:				
Guardianship for	38,169	4,514	18,643	61,326
Legal custodians for	38	68	8,962	9,068
Institutional awards	587	587
Total	38,794	4,582	27,605	70,981

Hospital and Domiciliary Care.—As of June 30, 1939, 54,117 beneficiaries were receiving hospital care and 15,426 were receiving domiciliary care authorized by the Veterans' Administration.

Of the number under hospital care, 4,979 were receiving treatment for tubercular ailments, 31,216 for neuropsychiatric diseases, 17,922 for general medical and surgical conditions.

There were 288 patients under observation, 58 were receiving temporary hospitalization, and 273 non-veteran patients were not classified as to type of disease.

The table on the next page does not include loans made to veterans secured by U.S. Government life insurance policies.

The total amount includes \$1,179,002,368.67 made available by deduction for allotment from the pay of World War veterans while in service, from amounts collected as premiums on the various forms of Government insurance, and amounts in other trust funds.

Total Disbursements to June 30, 1939

Compensation and pensions:	
World War	\$ 3,838,831,444.82
All other wars	9,692,849,075.74
Regular establishment	170,862,379.65
Payment to participants in yellow fever experiments	148,013.75*
Military and naval insurance	2,127,399,992.85
U.S. Government life insurance	378,378,768.63
Adjusted service certificates	3,739,878,169.54**
Adjusted service and dependent pay	52,986,457.12
Adjusted service and dependent pay 1937 and 1938	999,047.32
Loans to veterans for transportation	76,103.36
Hospital and domiciliary facilities and service (Constr.)	109,627,659.65
Vocational training	644,887,467.18
Allotments and allowances	582,941,586.07
Marine and seamen's insurance	35,078,013.20
Salaries and expenses (general administration)	1,900,908,000.61
Administrative expenses, Adjusted Compensation Payment Act, 1936	3,695,743.02
Printing and Binding	2,107,061.99
National Industrial Recovery Act. V.A. 1933-39	3,018,704.79
Public Works Administration Act of 1938 (Allotment to V.A.) 1938-1940	4,354,999.35
Horatio Ward Fund	21,742.33
General Post Fund	1,681,373.10
Funds due incompetent beneficiaries	565,482.25
Personal funds of patients, V.A.	7,956,172.33
Miscellaneous	901,021.07
Total	\$23,360,159,129.72

* Disbursements from June 30, 1931, to June 30, 1939.

** This amount represents payments made on adjusted service certificates and amounts reimbursed to the U.S. Government life insurance fund on account of loans made from that fund on certificates under the provisions of the World War Adjusted Compensation Act as amended, and the Adjusted Compensation Payment Act, 1936.

(See also ADJUSTED COMPENSATION.)

(F. T. H.)

Veterans of Foreign Wars.

The security of America was the guiding motif of the 1939 program of the Veterans of Foreign Wars of the United States, conducted through the nation-wide activities of more than 3,700 local V.F.W. units. Co-ordinated and directed by national V.F.W. committees and officers, the program of the organization, adopted by its 40th annual national encampment at Boston, Aug. 27-Sept. 1, 1939, included the following objectives: Adequate provision for America's disabled veterans; pensions for needy widows and orphans of all war veterans; pensions for all disabled war veterans; unalterable opposition to Communism, Fascism, and Nazism in America; maintenance of U.S. Constitutional rights of free speech, a free press, religious freedom, and rights of petition and assembly; a national defence that will guarantee security for America; enactment of a measure to take the profits out of war; neutrality for the United States in disputes between other nations.

Outstanding among the national V.F.W. activities for 1939 was its sponsorship, in the 76th Congress, of S. 1885, introduced in Congress on March 21, 1939, a proposal to take the profits out of war by taxing the profits out of war.

Other legislation instituted or supported by the V.F.W. in the 76th Congress included Public Law No. 196 which restored to a group of approximately 1,100 World War veterans compensations denied them by the Economy Act of 1933. Public Law No. 198, signed by the President on July 19, 1939, was a V.F.W. bill which liberalized eligibility to World War widows' pensions, increased from \$22 to \$30 a month the pensions of World War widows, increased widows' pensions in cases where the veterans died of service-connected disabilities and otherwise effected changes in existing laws concerning widows and orphans and veterans' benefits.

Progress also was achieved by the V.F.W. in its efforts to obtain wider veteran preference privileges in Government employment. As approved on June 30, 1939, the Emergency Relief Appropriation Act, Public Resolution No. 24, included provisions requiring employment or retention in employment on WPA projects of veterans (first) and other American citizens (second).

Consistent with its demand of many years for an adequate and effective national defence for the United States, the V.F.W. vigorously supported in the 76th Congress legislation providing more expansive and larger appropriations for national defence purposes than during any previous session of Congress since the World War.

One of the outstanding events of the year 1939 was the celebration on September 23, of the 40th birthday anniversary of the Veterans of Foreign Wars of the United States. Founded on Sept. 23, 1899, by a group of 13 Spanish-American War veterans at Columbus, Ohio, the organization now numbers approximately 250,000 veterans of the War with Spain, the Boxer Rebellion, Philippine Insurrection, World War, Nicaraguan campaigns and other armed expeditions under the Stars and Stripes during the last four decades.

The 1939-40 national officers of the Veterans of Foreign Wars of the United States are: Otis N. Brown, Greensboro, N.C., commander-in-chief; Dr. Joseph C. Menendez, New Orleans, La., senior vice commander-in-chief; Max Singer, Brighton, Mass., junior vice commander-in-chief; Robert B. Handy, Jr., Kansas City, Mo., adjutant-quartermaster general; Robert T. Merrill, Havre, Mont., judge advocate general; Dr. S. C. Bostic, New York city, surgeon general; Rev. Daniel F. Monaghan, Milan, Ill., national chaplain. National headquarters is maintained in the Medical Arts building, Broadway at 34th street, Kansas City, Mo.

(B. Y.)

Veterinary Medicine.

During the year 1939, the Federal Government established four research laboratories devoted exclusively to the study of poultry diseases and nutrition. These laboratories have been provided with well-appointed buildings, grounds, modern equipment, and capable personnel, and Congress has appropriated ample funds to carry out designated projects at each of them. John R. Mohler, chief of the Bureau of Animal Industry, United States Department of Agriculture, is charged with the supervision of this vast undertaking.

State universities of the principal States give short courses in avian medicine to veterinarians. Veterinary societies hold special sessions for that branch of their work. Fulltime poultry pathologists are now employed by some of the veterinary colleges.

Although the knowledge acquired through these intensive studies exceeds its rational application, the new relation of veterinary medicine to the development of this basic source of food supply is a matter of considerable national significance. The intent is to give poultry production the same scientific background as the other branches of American animal industry.

Rabies.—Increased interest in the eradication of rabies in animals was an incident of 1939. The occurrence of rabies in dogs and farm animals has mounted to such a height that dog societies which formerly questioned the very existence of the disease are requesting the Federal Government to assume the responsibility of controlling this terrifying scourge.

At the 1939 session of the American Veterinary Medical Association it was resolved that rabies could be easily eradicated by merely enforcing the usual measures governing the control of infectious diseases. To accomplish that end, it was recommended that the rabies problem be placed in the hands of the Federal and State veterinary services instead of leaving the enforcement of regulatory laws in the hands of local authorities who, regardless of their good intentions, are unable to overcome the prejudice against their efforts. The consensus was that rabies will vanish when eradicated from the domestic dog—the main reservoir of rabies virus. Much of the controversy over the handling of rabies centres around the compulsory use of rabies vaccine.

Equine Encephalomyelitis.—A strange event of the year was the sudden disappearance of encephalomyelitis of horses. Although the disease was unusually prevalent for several years in certain States bordering on the Mississippi and westward, only unconfirmed isolated cases occurred in 1939. A chemically killed virus vaccine was discovered in 1938 at the Rockefeller Institute of

Medical Research. Its immunizing value is practically faultless but whether its extensive use in 1938 and the spring of 1939 or unknown climatic influences account for the sudden disappearance is problematical but the fact remains that the suddenness of the change was spectacular. The occurrence of the disease in human beings, here and there, who were exposed to affected horses and the endemic in Massachusetts in 1938 gave this virus infection of horses the wide prominence which spurred the Federal and State services to institute active control measures.

Bovine Brucellosis.—The eradication of bovine brucellosis, commonly named contagious abortion or Bang's disease, continues under considerable difficulty. Prominent States refused to appropriate funds for work during 1939. The project has two schools of thought. The one favours the test-and-slaughter method, the other favours vaccination with avirulent cultures of Bang's bacillus. The former plan includes the payment of indemnities for the condemned animals. Collecting blood samples, sending them to a laboratory to test their agglutinating power, the keeping of records, and appraising the condemned, is a costly procedure and it is pointed out that a comparable disease—bovine tuberculosis—required 22 years of constant work and vast sums of money to reduce to a point of practical elimination throughout the United States. On the other hand, vaccination holds out hope of immediate results on a large scale at but nominal expense. The controversy is unsettled but the trend appears to lean toward vaccination under definite regulation.

The reported increase of brucellosis in man (undulant fever) has not impressed the public mind sufficiently to build up a demand for the eradication of the disease in cattle. Farm economics rather than public health still governs. The transmissibility of the disease to man, the lowered calf and milk production in infected herds, and recent observation that the incidence of mastitis is much lower in disease-free herds, have made the economic and public health phases of bovine brucellosis inseparable. The potentiality of all this became more generally comprehended during 1939.

Blacktongue.—Among recent researches of practical value are those of Elevjhem and Arnold of the University of Wisconsin who demonstrated experimentally that a fraction of the vitamin B complex—nicotinic acid—prevents blacktongue, a fatal, pellagra-like disease peculiar to dogs. In their hands, a ration depleted of this fraction caused blacktongue in its typical form. This work is noteworthy because it transposed to the list of preventable diseases a grave and quite common malady of the canine species. Moreover, it furnished additional proof of the relationship of diet to a definite clinical entity.

Fright Disease.—Another discovery of the same class as the foregoing was that of J. W. Patton, D.V.M., of East Lansing, Mich., who demonstrated experimentally that thiamin chloride, also a fraction of the vitamin B complex, prevents and cures the nervous disorder of dogs known as fright disease or running fits. By alternately depleting and replenishing the ration of the same group of dogs in such a way as to regulate the intake of thiamin chloride, a nervous crisis clinically analogous to fright disease was produced and cured at will with mathematical precision. Whether this discovery is applicable to other nervous phenomena affecting animals remains to be proved.

Modified Canine Distemper Virus.—A modified canine distemper virus that is avirulent for dogs, foxes, and mink and yet retaining high immunizing properties was developed by Green and Swale working among fur-bearing animals in Wisconsin. The virus is modified to the avirulent state by 50 or more passages through ferrets. At 20 passages, the virus recovered from the inoculated ferrets is still virulent but at 50 passages and upward it has lost its pathogenic power without, however, losing its ability

to confer immunity. The usefulness of this virus-vaccine has been proved by its use in thousands of foxes and several hundred dogs. The exact value in the domestic dog under natural conditions has, however, not been determined.

Mastitis.—On account of their insidious nature and prevalence bacterial diseases of the mammary glands of cows impose a difficult problem. The cow, the udder, and the particular quarter affected must be detected, in order to obtain a correct tableau of the herd's fitness to supply wholesome market milk. For this purpose a colorimetric test has been employed. A dram of milk is drawn into a test tube from each quarter and treated with a few drops of brom thymol solution. The colour changes in the milk samples determine the presence or absence of bacterial infection. (L. A. M.)

Victoria. Area 87,844 sq.mi.; pop. (est. March 31, 1939) 1,880,241. Chief towns (pop. Dec. 31, 1938): Melbourne (1,035,600); Geelong (40,050); Ballarat (38,430); Bendigo (30,030). Governor: Maj.-Gen. Sir W. J. Duggan.

History.—Following a very severe heat-wave in Jan. 1939 the most disastrous bush-fires in the State's history cost 67 lives and ravaged over 4,000,000 acres of valuable forest and grazing land, destroying several townships, thousands of head of stock and 1,000,000,000 feet of timber. A relief fund opened in Melbourne realized £248,000, and contributions came from elsewhere in Australia. A Royal Commission appointed to inquire into the causes of the outbreak and to suggest preventive measures for the future reported critically upon the Government's administration of forests. The wheat areas suffered not only from the drought but also from the worst floods for 20 years, which caused considerable loss at Easter in the north and north-west. A sum of £200,000 was made available for the relief of wheat growers.

Mr. Dunstan's government, the first Country Party administration in Australian history, remained in office throughout the year. An estimated surplus of £12,000 for the financial year 1938-39 became a deficit of £787,000 owing to the adverse seasonal conditions. The treasurer, in estimating a surplus of £4,000 for 1939-40, announced increases in the rates of company and individual income tax. Labour made substantial gains at the Melbourne City Council election in August. There was continued activity in the building trade. Progress was made with re-housing schemes in Melbourne, and with factory construction there and in Geelong. Manufacturing industries were prosperous, and factory employment high, chiefly in industries engaged in executing the Commonwealth government's defence orders. (L. R. Mc.)

Finance.—In 1937-38: Revenue £A28,938,052; expenditure £A28,907,107; debt outstanding (June 30, 1938) £A177,228,495.

Communications.—Roads and streets fit for motor traffic (Sept. 30, 1937) 104,087 miles. Railways (1937-38) 4,721 miles. Motor vehicles licensed (1937-38): cars, trucks, etc., 220,753; cycles 27,333. Wireless receiving set licences (Dec. 31, 1938) 322,885. Telephones (June 30, 1938) 198,761.

Agriculture, Manufactures, Mineral Production.—Production in 1938-39: wheat 18,104,360 bu.; wool 170,465,985 lb.; coal, brown (1938) 3,675,450 tons; gold (1938) 144,243 fine ounces. Industry and labour, 1938-39: factories 9,241; employees 201,789; gross value of output £A157,050,725; unemployment (Trade Union returns, average) 10.0%.

Vinyon: see CHEMISTRY, APPLIED; COTTON; INDUSTRIAL RESEARCH; RAYON.

Virginia, one of the original States of the United States, popularly known as "The Old Dominion"; first settled permanently in 1607; area 42,627 sq.mi.; population accord-

ing to U.S. census of 1930, 2,421,851; estimated July 1, 1939, 2,476,532; capital, Richmond, 182,929; seaport, Norfolk, 129,710. Of the State's population in 1930, 785,537 were urban, or 32.4%; 1,770,405 white; 650,165 coloured; 1,746,585 native white; and 23,820 foreign born.

History.—James H. Price is governor; Saxon W. Holt, lieutenant-governor; Raymond L. Jackson, secretary of State; and Abram P. Staples, attorney-general. Virginia's general election was marked by apathy for the most part. When the General Assembly meets in 1940, Democrats will hold all except three Republican seats in the Senate and seven Republican and two Independent seats in the House.

Education.—Virginia has a free school system for children from seven to 20, inclusive, which is compulsory for all between seven and 15 years. Physical training is obligatory; whites and Negroes have separate schools. The amended school census of 1935 recorded 735,198 children between seven and 19, inclusive; public school membership was 575,999 in 1938-39 session, for which total disbursements, including capital outlay of \$6,918,864.14, and debt service of \$2,217,238.49, were \$31,981,207.41, at per capita cost of \$64.82 based on the average daily attendance; length of school year, 180 days; 17,310 teachers were employed at average salary of \$837; average salary of teachers including supervisors and supervising principals, \$940; school property was valued at \$81,524,737. State expenditures for all educational purposes for fiscal year ending June 30, 1939, were \$21,103,822.84, 23.85% of total State expenditures. The State Board of Education accredited 38 institutions of higher learning. In 10 State-supported colleges, 26,701 attended 1938-39 regular sessions.

Public Welfare and Health.—Total State expenditures on public welfare for year ending June 30, 1939, were \$7,451,774.39, 8.42% of total State expenditures. There was \$1,819,663.91 spent on penal institutions; \$227,502.09, on industrial schools; \$1,897,856.64, on mental institutions; and \$1,791,870.04 was spent on non-institutional activities. State, Federal and local funds made a total of \$3,158,960.66 for public assistance in Virginia. Old age assistance applications were made by 225,231 persons, of which 15,237 were approved for an average grant of \$9.63 per case per month; 1,314 out of 1,717 applications for aid for dependent children were approved for an average grant of \$22.51 per month for each family of children; and approximately one-half of the 72,289 applications made for general assistance were for direct aid and the other half sought enrolment in Federal relief projects; 53,271 were approved for the service or assistance for which they applied. For the same period 29 rural health departments in 47 counties served 59.4% of Virginia's rural population. State expenditure on public health was \$1,964,362.09, 2.22% of total State expenditure.

Banking and Finance.—Jan. 1, 1939, Virginia had 187 licensed State banks and 132 national banks. Total assets of State banks, \$268,409,000; of national banks, \$406,417,000; combined total assets, \$674,826,000. Combined liabilities of State and national banks included aggregate deposits, \$585,327,000; capital stock, \$45,090,000; surplus, \$24,803,000; and net undivided profits, \$9,666,000. June 30, 1939, cash surplus in State treasury, \$11,597,799.36; gross bonded debt, \$20,813,064.02; assets in sinking fund, \$5,166,845.87; net debt \$16,646,218.15; no floating debt. Revenues and expenditures for fiscal year 1938-39 were \$92,930,621.11 and \$88,486,586.77, respectively. Assessed values of all taxable property in 1938, \$2,164,664,264.92.

Agriculture and Manufacturing.—The estimated 1939 total farm income, \$119,636,000, is 5% less than 1938. Forecast of crops, Nov. 1, 1939: bales: cotton, 12,000; bushels: apples (commercial), 7,500,000; barley, 2,400,000; buckwheat, 196,000; corn, 36,166,000; cowpeas, 105,000; oats, 2,020,000; peaches, 990,000;

pears, 189,000; potatoes, 6,873,000; rye, 588,000; soybeans, 375,000; sweet potatoes, 4,420,000; winter wheat, 7,946,000; pounds: peanuts, 184,800,000; tobacco, 130,198,000; tons: tame hay, 1,010,000. For the year 1938, a total of 2,316 manufacturing plants reported to the Department of Labor and Industry; their total wages, \$128,154,910, were paid to 160,451, the average number of wage earners; cost of their materials was \$509,178,382; and the value of their products was \$945,221,659. (J. S. Br.)

Virginia, University of. A State institution for higher education situated at Charlottesville, Va. The original university was designed and built by Thomas Jefferson. There are six departments; two academic—the college and department of graduate studies; and four professional—law, medicine, engineering and education. The institution has a productive endowment fund amounting to \$11,028,877, and receives from the State an annual appropriation of \$726,360.00 (1938-39). The total budget for 1939-40 was \$2,658,604.00. The corporate name of the university is "The Rector and Visitors of the University of Virginia." In 1939 the faculty and officers numbered 269 (professors and instructors); the students 2,934 (132 women; 2,802 men). Number of books in the library, 323,500.

The most significant developments in the physical plant of the University in 1939 were the completion of construction of the Neuro-Psychiatric Wing of the Hospital of the Medical School; and the Restoration of the Rotunda of the University, which is the central architectural building, designed and built originally by Thomas Jefferson. (J. L. N.)

Virgin Islands, a United States West Indian dependency east of Puerto Rico, comprising St. Croix, St. Thomas, St. John and smaller islands; language, English; capital, Charlotte Amalie (on St. Thomas); governor, Lawrence W. Cramer. The area is 133 square miles. Population (census, 1930) is 22,012 (a decrease of almost 16% since 1917 and less than half the early 19th century total), and is largely Negro and mixed. The principal cities are Charlotte Amalie (7,036), Christiansted (3,767), and Frederiksted (2,698). Government is administered by a governor appointed by the President of the United States, with legislative functions vested in the municipal councils of St. Croix and St. Thomas. Suffrage has been universal since 1938.

Developments during 1939 continued to be featured by economic rehabilitation. The United States policy of strengthening defences in Puerto Rico and the Virgin islands resulted in the allocation of \$350,000 for construction of additional naval facilities at Charlotte Amalie. External communication is by regular shipping services from New York and Puerto Rico, and by Pan American Airways. The islands depend primarily on sugar and rum, although economic diversification is being pushed, especially through the federally controlled Virgin Islands Company. A tourist trade is growing rapidly. In the year 1938, imports were \$3,345,363 (foodstuffs, 16.8%; fuel oil, 9.7%; machinery and vehicles, 4%), with 70.5% from the United States. Exports were \$1,294,285 (sugar and alcoholic beverages 55.8%), 94.4% to the U.S.

The monetary unit is the United States dollar. The United States contributed \$70,000 toward the operating expenses of the Virgin islands in 1939, as against \$140,000 in 1936. During 1939 there was considerable agitation to have customs receipts (which at present go into the United States Treasury) turned over to the Virgin Islands Government. Almost a fourth of the total expenditures go to education. There are 26 public and private schools, with total enrolment (1939) of 4,719, an increase of 1,470 in three years. Over 90% of the population is literate.

Vital Statistics: see BIRTH STATISTICS; DEATH STATISTICS; INFANT MORTALITY; MARRIAGE AND DIVORCE; SUICIDE STATISTICS.

Vitamins. During 1939 the structures of at least two vitamins have been determined and proved by synthesis. Further evidence of the nutritional significance of riboflavin and other members of the vitamin B complex has become available. Great interest in the practical applications of the newer knowledge has been evinced by numerous discussions of problems involved in retaining or restoring essential vitamins in processed foods.

A number of investigators in the research laboratories of Merck and Company, Rahway, N.J. especially Stiller and Harris and their collaborators, have succeeded in determining the structure of vitamin B₆ and in synthesizing the active compound. Vitamin B₆ is one of the less well known water-soluble factors found in yeast and other foods and known to be necessary for the prevention or cure of a dermatitis in experimental rats. The substance has now been shown to be 2-methyl-3-hydroxy-4:5-di-(hydroxymethyl)pyridine. After the pure compound was made available, Spies and his collaborators soon found that it may be of value, along with nicotinic acid and riboflavin, in the treatment of the multiple vitamin deficiency disease, pellagra.

Investigations in several laboratories have resulted in the accumulation of much more information about the chemical nature of vitamin K, the fat-soluble factor which prevents a haemorrhagic condition in animals fed diets lacking this vitamin. Previous reports have shown that administrations of vitamin K and bile are of great benefit in controlling the post-operative haemorrhages which often followed surgical operations for the relief of biliary obstruction. Vitamin K is found in some plant tissues such as alfalfa and it can be synthesized by certain bacteria such as the organisms which are responsible for the putrefaction of fish meal. Preparations of the pure vitamin have been obtained from both plant and animal sources, and in addition, synthetic organic compounds have been prepared which exhibit a vitamin K activity. It now appears that there is a group of substances related to alphanaphthoquinone and having the biological effects of vitamin K. It has been found that the vitamin K in alfalfa is 2-methyl-3-phytyl-1,4-naphthoquinone.

Riboflavin long has been known to be an essential constituent of one of the enzyme systems of the body which is concerned with the oxidation of organic food materials. No evidence of its importance to man was available until Sebrell and Butler described the symptoms which appeared in women who had been maintained on a diet deficient in riboflavin. The lesions observed consisted of macerated areas which progressed to transverse fissuring in each angle of the mouth. Other lesions of the mucosa of the lips and the skin around the nose and eyes were described. All of these lesions disappeared after the oral administration of synthetic crystalline riboflavin. Similar symptoms have been observed in pellagrins by Vilter, Vilter and Spies. These observations emphasize the view that nutritional deficiencies of man usually are multiple in nature.

Accumulating information regarding the vitamin intake of man has been summarized by Cowgill and emphasizes the desirability of increasing available supplies of vitamin B₁ in foods. The Council on Foods of the American Medical Association favours the addition of vitamin B₁ to ordinary wheat flour and to processed cereal foods to the extent that these foods, which make up so large a part of the modern diet of civilized man, may have the full vitamin B₁ value of the whole grain.

Vitamin B₁ is known to be concerned with the proper utilization within the body of carbohydrate. Stirm, Arnold and Elvehjem have described some interesting experiments in which polyneuritic animals had their symptoms alleviated by increasing the fat con-

tent of the diet at the expense of carbohydrate. Numerous studies of chemical methods for the determination of vitamin B₁ have been made, but the evidence is too recent to permit a critical evaluation. At the present time biological assay remains the method of choice. Wages and Hours. During the first 10 months of 1937 employment and payrolls in manufacturing and some of the non-manufacturing industries approximated 1929 levels. In Nov. 1937, employment fell off sharply. Payrolls during 1938 averaged only 70% of the 1937 payrolls. The recession in employment affected all of the major branches of industry, both manufacturing and non-manufacturing. It was accompanied by lower average hours per week, average earnings per hour, and average earnings per week in 1938. But in Feb. and Aug. 1939, selected as representative months, weekly hours were typically from two to six hours per week below the corresponding months in 1937. Weekly earnings in a large number of industries approximated those for the corresponding months in 1937; in some cases slightly exceeding the 1937 earnings, in more cases being slightly below them. This was due to a rise in average hourly earnings in a large number of industries ranging from two to eight cents above the figures for the corresponding months in 1937, and typically exceeding the 1937 earnings by five or six cents per hour.

Table I. *Employment, Payrolls and Earnings in Manufacturing Industries*

(Indexes are based on 3-year average, 1923-25=100, and are adjusted to 1935 census of manufacturers. Not comparable to indexes published by the U. S. Bureau of Labor Statistics prior to August 1938.)

This table compiled from tables published monthly in *The Monthly Labor Review*, United States Bureau of Labor Statistics.

The rise of average hourly earnings from 1937 to 1939 was an unusual event. In periods of increased unemployment, such as prevailed from late 1937 through 1938, labour ordinarily experiences reductions rather than increases in average hourly earnings. The contra-cyclical rise in hourly earnings 1937-39 appears to have been the result principally of the upsurge of unionism which began in 1933-34. By 1937 a large number of the new unions had become sufficiently consolidated and effective, and the older unions sufficiently strengthened, so that their increased bargaining power more than counterbalanced the temporarily adverse business trend of late 1937 and 1938 and enabled them, both in union and non-union industries, to push the wage level higher.

Table II reveals that the various industries were affected to different degrees by the recession of 1938 and the trend to recovery in the middle of 1939. Wholesale and retail trade, hotels and public utilities experienced but small reductions in hours from 1937 through 1938-39. They are industries which operate standardized hours if they operate at all and their employees' hours reflect the operating habits of the industries. But the Bureau of Labor Statistics figures show a downward trend of hours in these industries as well as in manufacturing, mining and construction during the period, and it is probable that it was in part due to reductions in hours-standards effected by union agreements. The rise in hourly earnings rates in 1938-39 as compared with 1937 may be illustrated by a few typical cases. The facts shown by these cases are not, of course, universal but they reflect the dominant trends of the period.

The much higher hourly earnings in some industries are due to one or more of the following factors: (1) character of the labour supply employed, as to sex, age and skill, (2) productivity of the industry, principally determined by its degree of modernization, technical equipment and proportion of skilled workers, (3) degree to which union working conditions prevail, (4) necessity of paying high wages to attract labour supply.

Weekly earnings are really of greater significance than hourly rates, from the point of view of living standards. The showing is definitely less favourable when weekly earnings are examined than when the hourly earnings column alone is inspected. There were only five industries of the 24 studied in which average

Table III. Rise in Hourly Earnings Rates in 1938-39

weekly earnings exceeded \$30 per week in Aug. 1939, and the maximum was \$33.87 in the crude petroleum and electric light and power industries. The lowest weekly earnings were in hotels, \$15.13.

Eight industries fell between \$20 and \$25 per week and nine between \$25 and \$30; three below \$20.

Another point should be noted in this connection. After calling attention to the wide variations in both hours and earnings which are found within each industry, both geographical variations and establishment variations, the U.S. Bureau of Labor Statistics pointed out that "there are indeed few industries that do not have submarginal fringes which create problems of a serious nature." (*Monthly Labor Review*, Nov. 1937, p. 1060.) It is these fringes which create many of the problems the Federal Wages and Hours Law was intended to remedy.

The wages of farm labour were closely similar in 1939 to 1938, judging by the reports of the U.S. Bureau of Agricultural Economics.

Monthly wages, with board, averaged \$28.28 in 1939, and \$28.25 in 1938; daily wages with board \$1.35 in Oct. 1939 and \$1.36 in 1938.

(See also LEGISLATION, FEDERAL; TEXTILE INDUSTRY; UNEMPLOYMENT; UNITED STATES.)

(D. D. L.)

Great Britain.—In the early part of 1939 the upward movement of wages was resumed on a small scale, the recorded in-

creases in weekly wages up to the end of August amounting to £114,000, as against decreases of £39,000. The rapid rise in prices after the outbreak of war naturally led to demands for higher wages; and by the end of November the total recorded net increases in weekly wages amounted to £650,000. The cost of living was practically the same at the outbreak of war as it had been a year before; but in September prices rose sharply, and by the beginning of December the official index of the cost of living stood at 173 (July 1914=100), as compared with 155 on September 1. Earnings, meanwhile, rose on account of more regular employment and overtime in the war industries, but fell in many consumers' and export trades which were dislocated by war conditions. In general, pur-

chasing power improved in the areas which had previously been most depressed, but fell off in London and in the centres dependent on light industries and luxury expenditure.

On the outbreak of war, the Government immediately took over the control of a large number of commodities and imposed regulations of prices over a wide field; and legislation was also passed (Price of Goods Act) for the purpose of restricting profiteering. But the fall in the value of sterling raised the cost of imports, and price increases were allowed to compensate for higher costs. The question speedily arose whether the financing of the war was likely to lead to an inflation of prices such as occurred between 1914 and 1917. The chancellor of the exchequer (Sir John Simon) appealed to the trade unions not to ask for wage-advances except in cases of absolute necessity; but the unions were reluctant to tie their hands in the absence of any assurances concerning the financial policy which the Government intended to pursue.

The question of wage-policy, in relation to the measures of price-control and the methods of financing the war, was of crucial importance. Save to the relatively small extent to which war costs can be met by the liquidation of overseas investments, or by new borrowing from abroad, the burden must obviously fall on current production. The expenditure of the Government was estimated in December as amounting to £2,400,000,000 a year, whereas the total national income in 1938 was about £5,700,000,000. Unless this latter total (in terms of goods produced) can be rapidly increased, it is clear that the war cannot be financed without some fall in the general standard of living. It should, however, be possible, in view of the existence of large-scale unemployment, to increase output considerably, given proper organization; and it is highly unsatisfactory that up to the end of 1939 there was no fall of unemployment even to the pre-war level.

In view of the impossibility of financing the war without inflation unless taxation is very greatly increased, various plans were put forward for a levy on wages as well as on higher incomes. The most important is the plan advanced by J. M. Keynes, under which a proportion of all incomes beyond a certain low minimum (graduated according to the number of dependents) would be paid to the Government, the levy being used in the first place in

payment of taxes, and the balance credited to the account of the payer in the post office savings bank.

Wake Island, a possession of the United States of America, since 1899, lies in mid-Pacific in lat. 19° 15' N., long. 166° 38' E. It is about 2,004 miles W. of Honolulu, Hawaii and 1,334 miles N.E. of Port Apra, Island of Guam. It has no native or permanent inhabitants and is a typical coral atoll of three small islets enclosing a shallow lagoon; total land area about 2,600 acres, much of which is from ten to fifteen feet above sea level. Wake Island is under the jurisdiction of the Navy Department which has granted Pan-American Airways permission to establish a temporary air base on Wake Island in connection with transpacific flights. (L. S. F.)

Walsh, Frank Patrick (1864-1939), American labour lawyer, was born on July 20 in St. Louis and attended St. Patrick's academy there before starting to work as a telegraph messenger. He studied shorthand and law at night, became a court reporter, and was admitted to the Missouri bar in 1889. Soon he became a prominent trial lawyer. After President Wilson took office in 1913 he appointed Walsh chairman of the Federal Commission on Industrial Relations. In 1918 Wilson appointed him and former President Taft joint chairmen of the War Labor Conference Board. He was counsel for individuals and unions in many prominent trials, including the Sacco-Vanzetti case. For 20 years he acted as defence attorney without pay for Tom Mooney. Walsh died in New York city on May 2.

* Represents Austrian indebtedness to the United States now charged to the German Government.

† The United States holds obligations in the principal amount of \$250,898,788, which, together with accrued interest thereon, are to be cancelled pursuant to agreement of April 13, 1938, between the United States and the Republic of Nicaragua, ratified by the United States Senate on June 13, 1938.

nations in the principal amount of \$10,338,312,074.70. Additional obligations amounting to \$12,167,000 were acquired from Greece in 1929. Funding agreements with 13 countries were reached during the years between 1923 and 1926; an agreement with Greece was made in 1929, and an agreement with Austria in 1930, setting their debt with interest to the respective funding dates at \$11,577,260,885 generally payable with interest charges over a period of 62 years. Of the others Cuba and Liberia paid their debt in full, and no agreements were ever reached with Armenia, Nicaragua and Russia. (E. S. D.)

War Propaganda: see PROPAGANDA.

Warsaw. Province and capital city of Poland until Sept. 1939; population (census 1931), 1,171,900; estimate, Sept. 1, 1939, 1,300,000; Poles about 950,000, Jews 350,000.

History.—Until the outbreak of the war, on Sept. 1, 1939, Warsaw was the political, commercial and financial centre of Poland. Since the resurrection of Polish independence, in 1919, a great centralization of power has taken place, and the capital city, in consequence, doubled its population in the last 20 years. From Sept. 1 to Sept. 27, 1939, when the city surrendered to Germany, it was subjected to constant bombardment from the air, and more than one-third of the buildings were either destroyed or

APARTMENT BUILDING IN WARSAW bombed early in Sept. 1939

badly damaged. The city, under the leadership of its mayor, S. Starzynski (*q.v.*), put up a stubborn resistance against overwhelming odds, and was the last Polish stronghold to surrender. Since the German occupation of the city, thousands of Poles and Jews, driven from smaller communities and from the Western part of the country, have come to Warsaw. On the other hand, many of the old inhabitants escaped into the Russian-occupied section of Poland. Warsaw is (Jan. 1, 1940) a part of the Gouvernement General of Poland, of which Cracow was made the capital. (S. SL.)

Washington, a State in the extreme North-west United States, popularly known as "The Evergreen State." Area, 66,836 sq.mi.; tidal shore line, 1,721mi.; population (U.S. census 1930) 1,563,396; estimate (July 1, 1938) 1,658,000. Capital, Olympia, 11,733; three largest cities (1939 estimates): Seattle, 406,543; Spokane, 135,000; Tacoma, 111,000. In 1930

the urban population was 884,539 or 56.6%. Native born whites dominate population percentages with 81.7%; of the 244,256 foreign born whites, Canada, Sweden, Norway, Germany and England furnished one-half. Negroes numbered 6,840; Japanese, 17,837; Chinese, 2,195; Filipinos, 3,480; Indians (Jan. 1938), 13,741.

History.—Washington celebrated its 50th anniversary of Statehood in 1939. The State legislature, preponderantly Democratic and conservative, met in its 26th session from January 9 to March 9. To meet the serious problem of finance, former exemptions from the sales tax of such items as fruit and fresh vegetables, dairy products and unsweetened bread, as well as of commodities purchased with relief vouchers were removed. At the same time the forty-mill limit bill as regards property taxes was placed upon the 1940 ballot as a legislative referendum measure, saving proponents of such limitations the effort and expense of an initiative petition. A general law as regards fair trade practices, as well as acts dealing with such problems in particular industries as apple growing and live stock, were passed. Ratification was extended to the Federal law of May 27, 1937, to prevent speculation in lands in the Columbia basin. Since the Supreme Court sustained its position as to eligibility of persons for old age assistance regardless of need, the legislature modified the State law and also barred such claims against the State based upon the old law. A commission to prepare for the Pacific Northwest Centennial Exposition, scheduled for Seattle in 1942, was created.

Records for continuous pouring of concrete were established at Grand Coulee. Clearing of the area to be covered by the reservoir behind the dam and the moving of towns to higher ground are proceeding rapidly. Of two important new bridges, one will cross Tacoma Narrows of Puget sound, the other, a concrete pontoon structure, will span Lake Washington.

The chief State officers are: Clarence D. Martin, governor; Victor A. Meyers, lieutenant-governor; Mrs. Belle Reeves, secretary of State; Cliff Yelle, State auditor; Phil H. Gallagher, State treasurer; G. W. Hamilton, attorney general; A. C. Martin, commissioner of public lands; William A. Sullivan, insurance commissioner; Stanley F. Atwood, superintendent of public instruction; John Sylvester, speaker of the assembly (26th, 1939).

Education.—The system of higher education includes a university, a State college and three colleges of education. During the school year 1938-39, average daily attendance in elementary and secondary schools was 280,613, the number of teachers employed therein 10,682. Total instructional cost was \$29,629,630.26 and such cost per pupil in daily attendance \$105.58. Salaries of teachers, exclusive of superintendents, averaged \$1,645.56.

Banking and Finance.—Revenues and expenditures for the year ending Dec. 31, 1939 represented an increase over previous years. Gross revenues amounted to \$94,024,648.67; the cash balance as of Dec. 31, 1938 was \$8,414,124.48. The gas tax contributed \$17,227,312.99, and the sales tax \$26,888,963.55. As total disbursements amounted to \$92,889,001.18, the cash balance on Dec. 31, 1939 was \$9,549,771.97. The bonded debt is \$12,111,000. One hundred and forty-four banks in the State reported total capital of \$26,829,000; capital, surpluses and undivided profits of \$54,557,000; deposits of \$568,701,000; resources of \$626,405,000.

Agriculture, Manufactures and Mineral Production.—Statistics as regards agriculture reflect, not merely capricious prices and curtailed markets, but slight tendencies toward shifting of

Leading crops	Value 1938	Av. Prod. 1928-37	Prod. 1938	Prod. 1939 (est.)
Wheat	\$23,755,780	43,729,000 bu.	51,643,000 bu.	39,678,000 bu.
Apples (commercial crop)	20,160,000	24,907,000 bu.	22,400,000 bu.	19,500,000 bu.
Hay (wild and tame) . .	14,750,000	1,658,000 tons	1,740,000 tons	1,866,000 tons
Potatoes	5,297,600	8,422,000 bu.	7,580,000 bu.	7,568,000 bu.
Pears	2,025,000	4,501,000 bu.	6,500,000 bu.	5,779,000 bu.
Oats	2,283,100	7,872,000 bu.	6,715,000 bu.	9,702,000 bu.

crops. Canning, particularly of prunes, has made definite strides.

The second largest wealth producer, timber, in which Washington outranks all States, has found wood-pulp for rayon an outlet in addition to saw lumber, shingles, veneer and plywood. Salmon and halibut remain the basis of the production of sea-foods, in which the State is also first. To preserve this important industry steps have been taken to safeguard the supply of salmon in the Columbia river basin both from excessive exploitation and from any injury which might result from the construction of the Coulee dam. Attributable largely to capital investments in equipment for reducing the lower grade ores is the remarkable increase in the mineral output, particularly of precious metals. The 1938 record exceeded that of 1937, to then an all-time high. Copper mining is making further progress. The State has 18% of the nation's potential water power. During 1935, 2,865 manufacturing concerns produced goods valued at \$478,385,098. (H. J. DE.)

Washington, District of Columbia, U.S., during 1939 continued to be the fastest growing city in the nation, and more than once rated second or third in monthly building permits, although it is 14th in size among the cities of the United States. The improvements in the Federal city in 1939 were made possible by a series of legislative and administrative acts during the past 150 years.

The National Capital Park and Planning Commission during 1939 made a land survey on which will be based a re-zoning of the city, authorized in 1938, which will reflect so far as possible the social needs of the population. The Navy department which is housed in a temporary building erected during the World War within the Mall will ultimately move to a new Navy building, to be built on the eminence overlooking the Potomac near the site of the Naval hospital which will be moved to the new Naval hospital in course of construction, near Bethesda, Md., all in accordance with approved plans.

A site has been selected for a permanent War department building and funds for the first unit have been made available. In south-west Washington, south of the Mall there were under construction buildings for the Social Security board, the Railroad Retirement board and a general office to house the Census work. The Apex building in the Triangle and the Annex to the Congressional library have been completed and occupied. The murals of the Canterbury Pilgrims in the latter building will be completed in 1940. The exterior of the beautiful Mellon Art gallery will be completed early in 1940. The Thomas Jefferson memorial is under construction in accordance with a plan for location developed and approved by the Planning Commission, altering materially, and removing practical objections to, the original plan.

Park progress under the Planning Commission during 1939 included a new span at the Virginia end of the Key bridge, a re-designed plaza at Rosslyn which will permit the opening of a section of the George Washington Memorial parkway from Key bridge to Memorial bridge in 1940. Montgomery county, Md., gave \$150,000, matched by a like amount from the Federal Government, to provide the first county unit on the Maryland Federal parkway to Great Falls. The signing of an agreement with the Maryland National Capital Park and Planning Commission for the extension of Anacostia park and parkway into Prince Georges county, Md., will result in the acquisition of 500 ac. of park land between the District of Columbia and Bladensburg. This will ultimately provide an approach to Washington via the proposed Baltimore-Washington parkway. A Sports Center has been planned at the Anacostia end of East Capitol street and an initial appropriation of \$2,700,000 has been made for a National Guard armory on this site. A stadium will next be undertaken, and grading in Dec. 1939 outlined the plaza approach and the embankment

overlooking the 30-ac. sports field and parade ground.

The Washington National Airport, on the Gravelly Point site recommended by the Planning Commission in 1927, was under construction during 1939 by the Civil Aeronautics Authority. With the relocation of the Mount Vernon Memorial highway and the provision of new approach roads Washington will have one of the most commodious and convenient airports adjacent to any American city.

The Alley Dwelling Authority program for 1939 included plans to erect about 3,000 dwellings on ten sites, five in down-town slum areas, one in a shack community, and four on vacant land, financed by loans of more than \$10,000,000 from the U.S. Housing Authority. Applications were filed during the year for loans of \$3,000,000 more for housing projects on three other sites. The 1939 projects were part of a long-term program that would extend over many years, designed to reclaim all slum areas in the nation's capital and at the same time assure an adequate supply of decent dwellings for all that part of the population not adequately served by private enterprise. (H. Js.)

Water Power. Total increase of the reported installed capacity of water wheels during 1939: 1,134,750 horsepower. Total capacity Jan. 1, 1939, about 65,000,000 h.p., therefore capacity Jan. 1, 1940 about 66,000,000 horsepower. Water power plants and capacities in different countries are reported as completed in 1939 or under construction at the end of the year as follows:

Argentina: On Tercero river at Almafuerie, Cordoba, 18,000 h.p., to be completed in 1941; on Arroyo Cobunco at Chos Mahal, Neuquen, 87 h.p., to be completed in 1940.

Australia: On Kiewa river near Tawonga, Victoria, 32,000 h.p.; on Mossman river near Mossman, 240 h.p.; extension of 2,000 h.p. to plant at Barron Falls near Cairns, North Queensland.

Bolivia: On Hankahuma river 50 mi. from La Paz, 2,500 h.p.; on Miquilla river 80 mi. from Eucalyptus, 3,500 horsepower.

Brazil: On Salso river at Cacapava, Rio Grande do Sul, 125 h.p.; on Ponto river at Ijuí, Rio Grande do Sul, 750 h.p.; on Prata river at Prata, Rio Grande do Sul, 150 h.p.; on Varro-Sai river at Itaperuna, Rio de Janeiro, 65 h.p.; on Lages river at Sao Joao Marcos, Rio de Janeiro, 47,000 h.p., to be completed in 1940; on Cadeia at Sao Leopoldo, Rio Grande do Sul, 1,000 h.p.; on Macabu river at Macao, Rio de Janeiro, 5,000 h.p., to be completed in 1942; on Batateira at Crato, Ceara, 170 h.p.; on Pirapama river at Escada, Pernambuco, 300 h.p.; on Jacupe-Mirun river at Aqua Prata, Pernambuco, 300 h.p.; on Santa Branca river at Nova Iguaçu, Rio de Janeiro, 900 h.p.; on Piracicaba river at Antonio Dias Abeixo, Minas Geraes, 2,600 horsepower.

Canada: The increase in installed capacity, 98,440 h.p., makes the total for the country 8,289,000 horsepower. The greater part of the increase consisted of extensions of existing plants, 87,000 horsepower. New plants completed: On Charlot river at Wellington lake, Sask., 3,300 h.p.; on Duck river at North Wind lake, Ont., 2,000 h.p.; on Black river near Heron bay, Ont., 1,500 h.p.; on Catarqui river at Brewers Mills, Ont., 999 h.p.; on La Sarre river near La Sarre, Que., 700 h.p.; on Petite river at Conquerall Mills, N.S., 600 h.p.; and on Barrie brook near Mulgrave, N.S., 500 horsepower.

Ceylon: None in 1939, start of war caused temporary discontinuance of a 33,500 h.p. plant.

Chile: On Mapocho river about 25 mi. from Santiago, 2,400 horsepower.

China: Three water power projects under consideration and construction total 134,000 horsepower.

Chosen: An extensive program of water power development is in progress in connection with industrial and irrigation activities. In North Heian province, seven plants with total ultimate capacities of 2,200,000 h.p.; in Keilli and Kogen provinces, three plants with total ultimate capacities of 625,000 h.p.; in North Zeara province, three plants with total capacities of 90,000 horsepower.

Ecuador: On Ambí river at Iharra, Imbabura, 450 h.p.; on San Pedro river at La Estela, Pichincha, 7,500 h.p., scheduled for completion in 1939 but work suspended for lack of balance of German-made power installation; on Money river at Cuenca, Azuay, 475 h.p. additional; on Pisque river at Tabacundo, Pichincha, 62 h.p., to be completed in 1940; on Pilalo river at Macuchi, Cotopaxi, 1,200 h.p., to be completed in 1940.

Eire: On Liffey river at Poulaphuca, 20 mi. from Dublin, 47,000 h.p., to be completed in 1941.

Finland: Five plants, 162,300 h.p.; 1940-41 two plants 173,500 horsepower.

Guatemala: On Michatoya river near Escuintla, 3,300 horsepower.

Iceland: On Laxaa river near Akureyri 2,000 horsepower.

Japan: Twenty-five plants, 160,000 horsepower. To be completed 1940 to 1943, 13 plants, 69,000 horsepower. Date of completion not reported, 11 plants, 225,000 horsepower.

Latvia: On Daugava river at Kecums 47,000 h.p.; extension of 23,500 h.p., to be completed in 1940.

Newfoundland: On Exploits river at Grand Falls, 35,000 h.p. additional; on Waterfall brook at St. Lawrence, 500 horsepower.

New Zealand: On Rakaia river at High Bank, South Island, 33,000 h.p., to be completed in 1941; on Cobb river near Mount Cobb, 12,000 h.p., date of completion not reported; on Waikaretaheke river near Waikaremoana, North Island, 27,000 h.p. additional, 54,000 h.p., to be completed in 1941; on Waikato river at Arapuni, North Island, 56,000 h.p., to be completed in 1941; Waitaki river near Kurow, South Island, 40,000 h.p., to be completed in 1940.

Norway: Eight new plants (30,200 h.p., includes 10,000 h.p. reported in 1938 as completed but not finished until 1939); extension of 80,050 h.p. at 11 plants (includes 12,000 h.p. reported completed in 1938 but not finished until 1939); 35,000 h.p. at new plants to be completed in 1940 and 1941; extension of 14,400 h.p. at six plants to be completed in 1940.

Peru: On Chili river at Charcani, Arequipa, 5,000 h.p.; on Chicama river at Usquil, Trujillo, 40 h.p.; on Mautaro river at Jauja, 217 h.p.; on Cafiete river at Jachahita, Lunahuana, 75 h.p.; on Huallaga river at Huanuco, 500 h.p., to be completed in 1940; on Concepcion river at Aracucho, 150 h.p.; on Cajas river at Tayabamba, Trujillo, 40 horsepower.

Sweden: Six plants, 83,000 h.p.; six plants, 280,000 h.p., to be completed 1940-42.

Switzerland: Two plants, 140,300 h.p., scheduled for completion in 1940.

Tasmania: On Nive river at Tarraleah project, extension of 42,000 h.p., to be completed 1942-43; on Ouse river, 12 mi. south of Great Lake, extension of 32,000 h.p., completion in 1942-43.

United States: The increase of 393,000 h.p. in completed power plants is divided between new plants, 173,000 h.p. and additional units on Colorado river at Boulder dam, 220,000 h.p., making this plant the largest in the world, with 1,057,000 horsepower. The larger new plants are on Tennessee river at Guntersville, Ky., 102,000 h.p.; on North Platte river at Seminole dam, Neb., 43,400 h.p.; on Penobscot river at Mattaseunk, Me., 12,800 h.p.; on Kennebec river at Solon, Me., 10,700 horsepower. The following plants were under construction: Big Thompson development, Colo., two plants 29,000 h.p.; ultimate capacity 6 plants, 190,000 h.p.; on Missouri river, Fort Peck, Mont., 500,000 h.p.; on Rio Grande river, N.M., 32,500 h.p.; on Brazos river, Tex., 34,000 h.p.; on Colorado river (of Texas) at Marshall Ford, Tex., 50,000 h.p.; at Austin, Tex., 15,000 h.p.; on Colorado river near Parker, Calif., 121,000 h.p.; on Minidoka river, Idaho, 6,700 h.p.; on Tennessee river at Gilbertsville, Ky., 220,000 h.p.; at Hiwassee dam, N.C., 80,000 h.p.; at Chickamauga, Tenn., 108,000 h.p.; at Pickwick Landing, Tenn., 96,000 h.p.; at Watts Bar, Tenn., 126,000 h.p.; Santee-Cooper development, South Carolina, 213,500 h.p.; on Saluda river near Chappells, S.C., 22,200 h.p.; on Neosho river at Pensacola, Okla., 80,000 h.p.; on North Platte river near Brady, Neb., 24,000 h.p.; near Lexington, Neb., two plants, 72,000 h.p.; on Rio Grande at Elephant Butte dam, N.M., 34,500 h.p.; on Columbia river at Bonneville dam, Ore., 148,000 h.p.; Central Valley project, Sacramento river, 407,000 h.p.; on Columbia river at Grand Coulee dam, 460,000 horsepower. The total capacity of water power plants of 100 h.p. or more in the United States at the end of 1939 was about 18,340,000 horsepower. (See also TENNESSEE VALLEY AUTHORITY.)

The following countries report no water power plants constructed during 1939: British Guiana, British Honduras, Costa Rica, Cuba, Dominican Republic, Estonia, French Indo-China, Great Britain, Greece, Haiti, Honduras, Iran, Iraq, Morocco, Nicaragua, Rumania, Syria, The Netherlands, Tunisia, Turkey.

No reports have been received from the following countries: Belgium, Bulgaria, Denmark, France, Germany, Hungary, Italy, Madagascar, Manchoukuo, Mexico, Poland, Uruguay, Union of Soviet Socialist Republics. (See also DAMS; ELECTRIC LIGHTING; ELECTRIC TRANSMISSION AND DISTRIBUTION.) (N. C. G.)

Watts Bar Dam: see TENNESSEE VALLEY AUTHORITY.

Wealth and Income, Distribution of.

Official Government estimates of the size distribution of the total income in the United States and of the expenditures of income by consumers appeared for the first time when the National Resources Committee published a report in 1938 entitled "Consumer Incomes in The United States" and another in 1939 entitled "Consumer Expenditure in The United States." These figures, showing the number of families or consuming units receiving incomes of varying amounts and making expenditures for different purposes, are based largely on a survey of approximately 300,000 American families in a year covering part of 1935 and part of 1936. Although admittedly subject to considerable limitation, the estimates have been generally accepted as the best yet prepared. The income concept used by the National Resources Committee includes income from personal efforts, income derived from the ownership of property, direct and work relief, and gifts used for current living expenses. Gains and losses from sale of capital assets, except those both bought and sold within the year studied, in-

heritances not used for living expenses, soldiers' bonus payments and borrowed funds were not included as income. Expenditures were classified into approximately 15 categories of commodities, services, and savings.

According to the National Resources Committee study, half of the families and single individuals in the United States in 1935-36 had incomes below \$1,070. The half whose incomes exceeded \$1,070 received 79% of the total income and the other half received 21%. The highest 5%, with incomes of \$3,400 or over, received 27% of the aggregate income, which is approximately the same amount as that received by the lowest 60%, with incomes of \$1,275 or less. Further evidence of the degree of inequality in the distribution of income is revealed in the table on the next page, which shows the percentages of consuming units receiving less than specified amounts of income, and their proportion of the total income.

This table also includes the estimates for 1929 of the Brookings Institution, and the estimates for 1910 of Willford I. King. It should be noted that the nature of the source material, the concepts of income, and the methods of estimation differ somewhat for each of the three estimates of income distribution and as a result their comparability is seriously impaired. Particularly important is the inclusion of realized gains and losses from the sale of securities and of other capital assets in the Brookings estimates for 1929, and the exclusion of this item in the National Resources Committee figures.

The available information hardly permits conclusions concerning the long-time trends in the distribution of income. In making comparisons between the three sets of estimates shown in the table, it is important to give consideration to many qualifying factors. The size of the total income should be considered in studying the distributions. Total family income was estimated by King to be slightly in excess of \$30,000,000,000 in 1910; the Brookings total estimate was above \$90,000,000,000 for 1929; and the 1935-36 estimate of the National Resources Committee was approximately \$60,000,000,000. Living costs were nearly one-fifth lower in 1935-36 than in 1929, and perhaps 40% lower in 1910 than in 1929. Also, a larger portion of the population lived on farms in 1910 than in 1929 and 1935-36.

Uses of Income.—There are marked differences in expenditure patterns of families in different income levels, according to the National Resources Committee report entitled "Consumer Expenditure in The United States." For the lower two-thirds of all income recipients in the United States in 1935-36, aggregate consumer expenditures and personal taxes were in excess of their incomes, the balance having been met from accumulated savings, loans, store credit, or other forms of borrowing. On the other hand, the upper third of families and single individuals, where incomes ranged upwards from \$1,450 for the year 1935-36, saved 19% of their income after all consumption expenditures and outlays for gifts and taxes. The highest one-tenth of income recipients saved about 30% of their income, whereas the lowest one-tenth of consuming units, whose incomes were under \$340 for the year, reported outlays for current consumption half again as large as their aggregate income.

Of all disbursements for consumption items in 1935-36, the lower income third of the nation's consumer units accounted for only 14.4% as compared with 27.7% for the middle third and 57.9% for the upper third. The upper third accounted for 71% of all consumer expenditures for recreation, 75% of all consumer outlays for automobiles and 77% of all disbursements by consumers for education. About 43% of the consumption expenditures of the lower third of income recipients was spent for food, nearly one-third for shelter, and nearly 9% for clothing. Of the consumptive expenditures of the upper third income class, these

three items absorbed slightly under 30%, approximately one-third, and 11%, respectively.

Income Distribution by Type of Payment.—The flow of income can also be analyzed by type of payment. Estimates of income paid out, representing payments by business enterprises to individuals for services rendered in the form of labour, management, capital and land, have been prepared by the Department of Commerce since 1929 and by the National Bureau of Economic Research back to 1919. Generally, the total compensation of all employees accounts for nearly two-thirds of total income paid out, with entrepreneurial withdrawals and return on ownership each accounting for about one-sixth of the total.

Over the past two decades, labour's share of total income paid out has varied only moderately. Entrepreneurial withdrawals have declined relatively as a result of the declining importance of agriculture. The trend toward incorporating of business enterprises effects a shift from entrepreneurial income to dividend and interest income. Interest payments have increased slightly in proportion to total income paid out, while dividends have increased and net rents and royalties have decreased in relative importance. For 1938, the Department of Commerce estimates show the compensation of employees representing 67.3%, dividends and interest 13.0%, entrepreneurial withdrawals 16.1%, and net rents and royalties 3.6% of the aggregate income paid out. These proportions vary substantially from industry to industry. Also, different types of income vary greatly in relative importance at different income levels, with dividends and interest significant in the higher income classes and wages and salaries being predominant in the lower income groups.

Income Distribution By States.—In May 1939 the United States Department of Commerce issued the first official estimates ever developed of the distribution of income among the various States. These figures covered the years 1929 to 1937, inclusive, and included total and per capita incomes and a breakdown by type of income payment for each State. For 1937, the average income per person in the United States was \$547 and the average was higher than this level in 20 States and the District of Columbia. In Delaware, Nevada, New York, California and the District of Columbia, the income per person was more than 50% above the national average. On the other hand, in Mississippi, Arkansas, Alabama and South Carolina, the average income was less than half the national average. Thus in each of the top income States listed above, average incomes were more than four times as large as in the four lowest income States listed. Differences in per capita incomes are not wholly indicative of differences in welfare because of variations in living standards and costs geographically and between different sized communities.

Income fluctuations from year to year varied widely among States. Income payments for the United States were 12% lower in 1937 than in 1929, but in the District of Columbia and seven States, the 1937 income exceeded that of 1929. On the other hand, in six States, income in 1937 was one-sixth or more below 1929. Similar differences appeared in the drop subsequent to 1929 and in the 1932-33 to 1937 recovery period.

Distribution of National Wealth.—No official estimates of the total national wealth or of its distribution have been made since 1926, when the Federal Trade Commission issued a report entitled "National Wealth and Income."

This report, in which the wealth figures were based primarily on the Bureau of the Census wealth estimates, showed a total national wealth in 1922 of \$353,000,000,000, as compared with \$205,000,000,000 in 1912.

As evidence of the distribution of wealth among individuals, the Federal Trade Commission agents gathered data on the values of 43,512 estates of deceased persons in a dozen widely scattered States over the period 1912-23. The size distribution of these estates cannot be accepted as indicative of the size distribution of wealth among all living individuals.

The study showed that 1% of the estates held 59% of the total wealth of the estates analyzed, and more than 90% was accounted for by about 13% of the estates. The data tended to show a declining degree of wealth concentration between 1912 and 1922 and a greater degree of concentration in cities than in towns and rural areas.

Using a variety of data and methods of estimation, Dr. Willford I. King developed estimates of the distribution of wealth among property owners in the United States as of the close of 1921. These estimates appeared in the June 1927 issue of the *Journal of the American Statistical Association*. Approximately half of the 41,000,000 property owners in the United States were estimated as owning less than \$2,500 each, and in the aggregate less than 10% of the national wealth. The 10% who owned more than \$10,000 each, held nearly two-thirds of the total wealth. The highest 2% owned 40% of the total, and the highest 1% owned approximately one-third.

The lack of recent estimates of total wealth and its distribution may be explained by the difficulty of preparing such estimates and the relatively limited use and value of wealth estimates. Many objects of wealth do not change hands at frequent intervals, and it becomes necessary to place arbitrary valuations on such objects. Even where a continuous market exists, the determination of proper valuation is uncertain. In the case of corporations, the book values and the market values of the securities are greatly different and there are arguments in favour of the use of each.

Wealth is primarily important as a source of income and, therefore, income figures largely defeat the need for wealth data. Also, wealth estimates include only the value of existing commodities and take no account of the value of human skills and abilities. With the increase in large corporations and absentee ownership, wealth is not necessarily related to the exercise of business control. It is generally conceded that income figures are of greater significance than statistics on wealth. (See also NATIONAL INCOME.)

(R. R. N.)

Percentages of Consuming Units Receiving Incomes Under Specified Amounts, Their Incomes and Their Outlays.

Income Classes (In dollars)	Family Incomes, 1910 (Willford I. King)		Family Incomes, 1929 (Brookings Institution)		Family Incomes, 1935-36 (National Resources Committee)		Family Outlays, 1935-36 (National Resources Committee)

Weather: see METEOROLOGY.

Weber, Herman Carl (1873-1939), U.S. clergyman and editor, was born February 9 at Mina, N.Y., and received his bachelor's and master's degrees at Rutgers university. He also received degrees of divinity at the New Brunswick (N.J.) Theological seminary in 1898 and at Albany (Ore.) college in 1927. He held several Presbyterian pastorates in New York State, and after 1929 directed every membership canvass of the general council of the Presbyterian church in the U.S.A. He was editor of the *Year Book of American Churches* and author of several volumes on the statistics of church membership. He died at East Orange, N.J. on July 25.

Welfare Work: see SOCIAL SERVICE.

Wellesley College in Wellesley, Mass., founded in 1870, is a four-year liberal arts college enrolling approximately 1,500 women. It is pre-eminently for candidates for the B.A. degree, but also offers the degrees of Master of Arts, Master of Science, Master of Arts in Education, and a certificate in hygiene and physical education. At Wellesley there are chapters of Phi Beta Kappa and Sigma XI.

In 1939 there were nearly 13,000 graduates, representing a wide variety of interests. The faculty numbered 201 men and women trained in nearly 100 universities and colleges. The self-perpetuating board of trustees consisted of 24 men and women. The college had trust funds amounting to \$10,129,960.60, and a plant valued at \$11,033,856.30.

Wellesley tradition includes an emphasis on scholarship, intelligent religious interest, constructive citizenship and aesthetic appreciation. (M. H. McA.)

West Africa, British: see BRITISH WEST AFRICA.

Westermarck, Edward Alexander (1862-1939), Finnish sociologist and anthropologist, was born at Helsingfors on November 20 and educated at the Swedish lyceum in that city and at the University of Finland. From 1907 to 1930 he was professor of sociology at the University of London and afterwards emeritus professor of philosophy at the Academy of Abo. Westermarck wrote and lectured extensively on the origin of ethics and the development of marriage as a social institution. His *History of Human Marriage* (1891) was translated into six languages and went through five editions. His most recent works were *Ethical Relativity* (1932), *Early Beliefs and their Social Influence* (1932), *Pagan Survivals in Mohammedan Civilization* (1933), *Three Essays on Sex and Marriage* (1934), *The Future of Marriage in Western Civilization* (1936), and *Christianity and Morals* (1939). For his other writings see *Encyclopædia Britannica*, vol. 23, pp. 524-5. He died at Lapinlahti, Finland, on September 3.

West Indies, an archipelago between Florida and South America, including the Greater Antilles (Cuba, Puerto Rico and Jamaica, with lesser, dependent islands) and the Lesser Antilles; languages, Spanish, English, French and Dutch. The area is approximately 99,000 square miles. The population (estimated at approximately 12,300,000 in 1939) is predominantly white in Cuba and in Puerto Rico, and 80% to 99% negroid elsewhere, except in Trinidad, where around 40% is East Indian. The archipelago includes three republics, two dependencies of the United States and six British, two French and one Netherlands dependency. Trade is chiefly with the United States and, in the European colonies, with their respective metropolises, with im-

ports usually foodstuffs, especially flour, textiles, and manufactured articles. Exports are sugar, principally, and other tropical agricultural products, and, from Trinidad and Curaçao, petroleum products. Resources are almost entirely agricultural, except in Cuba and Hispaniola, which have some undeveloped mineral deposits, and in Trinidad and Curaçao. European war conditions caused serious economic dislocation late in 1939, but gave promise of eventual trade benefit, especially through increased demand for sugar and enhancement of the tourist trade. (See also BAHAMAS; CUBA; CURAÇAO; DOMINICAN REPUBLIC; GUADELOUPE; HAITI; HISPANIC AMERICA AND THE EUROPEAN WAR; MARTINIQUE; PUERTO RICO; VIRGIN ISLANDS; WEST INDIES, BRITISH.)

BIBLIOGRAPHY.—*The West Indies Year Book for 1939* (London, 1939). (L. W. BE.)

West Indies, British. The several British islands in the West Indies; language, English. Politically, the islands are administered separately or in groups as British crown colonies: Jamaica; the Leeward Islands, a loose federation of the presidencies, or colonies, of Antigua, St. Kitts-Nevis, Montserrat, Virgin Islands (British) and Barbados; Trinidad and Tobago; and Grenada, St. Lucia, St. Vincent and Dominica, otherwise separate colonies, but collectively called the Windward Islands and administered under a common governor, who usually resides at St. George's, Grenada. By Act of Parliament of March 30, 1938, the transfer of Dominica from the Leeward Islands administration to that of the Windward Islands was ordered, effective Jan. 1, 1939, but, due to technical details, actual consummation of the transfer has been delayed.

Each colony has a governor or other chief executive appointed by the Crown (for names of governors, see BRITISH EMPIRE), an appointed executive council, and a partially elected legislative council or assembly. Barbados has a representative legislature but not full responsible government, and is the only colony electing a majority of its legislative body, which is the third oldest elected body in the British Empire. On Jan. 26, 1939, Barbados celebrated the tercentenary of the establishment of representative government in the colony. Suffrage and office holding are generally restricted by property qualifications.

Table 1. Areas and Population of British West Indies

Colony	Area (sq. mi.)	Pop.	Capital
Jamaica (including Turks and Caicos and Cayman Is., 306 sq. mi.)	4,846	1,173,645	Kingston (76,986)

History.—The most important development in British West Indian history during 1939 was the report of the Royal Commission of Inquiry appointed in Nov. 1938 to investigate economic and social conditions. The report, made public in August, deplored unsatisfactory housing and living conditions generally, and urged establishment of part-time workers as peasant proprietors, improvement of housing standards, creation of agricultural aid societies, greater attention to health, and the providing of meals

and milk to undernourished school children. Imminence of war when the report appeared, however, prevented its receiving wide attention in Great Britain. In January, following cessation of a general strike which had paralyzed Jamaica economically, the Jamaica government had promised economic and social reforms, but when it failed to effect them immediately a strike of waterfront workers (in mid February) brought new disturbances and obliged the governor to proclaim a state of emergency for several days.

Outbreak of the European war, in Sept. 1939, had immediate repercussions throughout the British West Indies, as the colonies immediately put themselves on a war footing. Trinidad and Jamaica granted their respective governors emergency powers and imposed press censorship. Price regulation was resorted to in an attempt to hold down the mounting cost of living, a licence system on imports was set up. The licence system was made necessary by the decline of the pound sterling in terms of the dollar, and consequent shortage of exchange.

Despite the various restraints imposed, the first month of war saw heavy price increases, especially in Jamaica, and a retrenchment in that colony's public works program and other governmental activity as a result of rising costs. Nevertheless, the agricultural situation was regarded as satisfactory, especially in Trinidad, where the outlook was for higher agricultural prices for commodities. Trinidadian oil production likewise was high.

In October, a wave of sharp indignation swept the entire British West Indies when a United States Senator formally proposed that the United States seize the British islands as the only means of obtaining repayment of the British debt to the United States.

Communication.—Under normal conditions the West Indies are adequately supplied with communications. Steamship lines from Europe and from the American mainland provide frequent, direct service between the more important islands and the outside. Kingston, Port-of-Spain, and Bridgetown are important ports of call.

Only Jamaica, with 210mi., and Trinidad, with 123mi., have railways. Roads are adequate for local needs. The Pan American Airways system provides regular, frequent air transport service to Kingston, St. John's, Bridgetown and Port-of-Spain, as well as to the principal non-British islands. From these points steamer connections are made to the lesser islands. In 1939 air service from Port-of-Spain was inaugurated to Tobago, and to Barbados.

Commerce and Industry.—Except in Trinidad, where petroleum (19,265,000bbls. in 1939) and asphalt dominate the economic life, and Barbados, where some petroleum deposits exist, the British West Indies lack mineral resources.

Agriculture and the processing of its products (especially sugar) is practically the sole basis of economy except in Trinidad. A wide diversity of agricultural commodities is produced, but sugar, bananas, cocoa and cotton are generally important. Over 200,000ac. are planted in sugar. Under the International Sugar Agreement of 1937, sugar production has been restricted by quota, however, with the entire islands allotted 413,350 long tons (Trinidad and Tobago, 132,200 tons; Barbados, 109,200 tons; Jamaica, 82,400 tons; Leeward Islands, 59,500 tons; Windward Islands, 10,050 tons). Against this allocation, the estimated yield for 1938-39 was 417,550 tons. A large portion of the sugar is processed into rum and molasses.

Approximately 76,022ac. are in bananas, almost entirely in Jamaica (72,909ac.). Export of 23,811,337 stems in 1938 made the island the world's leading banana exporter. Over 88% went to Europe.

An area of 237,014ac. is devoted to cocoa (210,000ac. in Trinidad and Tobago, 20,500ac. in Grenada). World overproduction is a serious obstacle to the industry. Cocoa comprises over half of

Grenada's exports, 7% of Trinidad's.

Approximately 105,375ac. is devoted to coco-nuts, with Trinidad and Tobago leading (52,500ac.), Jamaica second (40,074ac.). Jamaica, however, leads in exports, shipping 33,415,393 out of the 41,000,000 nuts exported by all the islands. St. Lucia, Trinidad and St. Vincent are next in coco-nut export.

In 1938, 21,600ac. were planted in cotton (mostly sea island). Production was 5,165 bales of 400lb. (including 4,440 sea island), with 1,687 bales in Montserrat, 1,100 in St. Vincent.

Coffee, mostly low grade but with some of very high quality, is grown in Jamaica, Trinidad and Dominica. Out of 10,000,000lb. exported in 1938, 94% was from Jamaica.

Citrus fruits (8,970ac.) are grown in Trinidad, Dominica, Jamaica, St. Lucia, Virgin Islands and Antigua.

Jamaica has experienced considerable development since 1933. Dominica, St. Lucia and Trinidad are among the world's chief lime juice producers.

St. Vincent is the world's leading supplier of arrowroot, exporting 8,179lb. in 1938, valued at £91,638 (44% of the export total). Grenada is important for nutmegs, exporting 3,676,512lb. in 1938 (£105,264 value, or 33% of all exports). St. Vincent, Trinidad and St. Lucia are minor producers.

Jamaica, in 1938, exported 1,308 tons of ginger. Some ginger is produced in Dominica, St. Lucia and St. Vincent. Jamaica is virtually the only producer of "allspice," exporting £207,070 value in 1938.

Table II. Imports and Exports of the British West Indies

Colony	Imports		Exports	
	1937	1938	1937	1938
Trinidad and Tobago. . .	\$35,836,000	\$35,497,000	\$33,702,000	\$35,368,000
Jamaica	\$20,485,000	\$24,994,000	\$23,821,000	\$25,033,000
Barbados	\$2,221,000	\$2,087,000	\$1,647,000	\$1,354,000
Grenada	\$381,000	\$304,000	\$401,000	\$315,000
St. Kitts-Nevis	\$284,000	\$302,000	\$387,000	\$260,000
Antigua	\$271,000	\$242,000	\$339,000	\$222,000
St. Vincent	\$203,000	\$199,000	\$187,000	\$211,000
St. Lucia	\$245,000	\$189,000	\$147,000	\$135,000
Dominica	\$125,000	\$103,000	\$73,000	\$78,000
Montserrat	\$64,000	\$59,000	\$61,000	\$38,000
Virgin Islands	\$13,000	\$14,000	\$11,000	\$10,000

Great Britain supplies approximately a third of the imports of Jamaica and Trinidad, 40% of those of Barbados and from 40% to 55% of the Leeward and Windward islands imports, while Canada sends from 12% (Trinidad) to 22% (Grenada), the United States from 12% in Barbados to 14% in the Leeward and Windward islands (less in the smaller ones). Exports to Great Britain range from 35-40% in the Windwards to 60% from the other colonies (5% from Trinidad and Tobago). The United States buys almost a third of St. Vincent's exports, 26% of the Leeward's, 10% of Trinidad's and down to 3% of Jamaica's.

The monetary unit is the pound sterling, except in Trinidad, where it is the Trinidad dollar (approximately equal to the U.S. dollar).

(L. W. BE.; M. L. M.)

West Virginia, sometimes called the "Panhandle State," was formed from Virginia during the Civil War and admitted to the Union, June 20, 1863. It has an area of 24,170 sq.mi. Its population in 1930 was 1,729,205 of which 1,613,934 were whites (51,520 foreign-born). Its total urban population was 491,504. Its population July 1, 1937, was estimated at 1,865,000. Its capital is Charleston (population over 60,408). Its other chief cities are Huntington (75,572) and Wheeling (61,659). It has 3,928mi. of steam railway, 233mi. of electric railway and a new and extensive system of improved highways (over 12,044 miles).

The chief State officers in 1939 were: governor, Homer A. Holt; secretary of State, William S. O'Brien; treasurer, R. E. Talhott; auditor, Edgar B. Sims; attorney-general, Clarence W.

Meadows; commissioner of agriculture, J. B. McLaughlin; superintendent of schools, W. W. Trent.

Education.—Education is free in the public schools for all children between six and 20 years of age and is compulsory for all between seven and 16. The pupil enrolment in the State elementary schools for 1938-39 was 318,286. In the 378 State high schools it was 132,458. The number of teachers was 11,334 in the elementary schools and 4,839 in the high schools. The total State appropriation for elementary and secondary education in 1938-39 was \$14,341,498 (of which the general school fund was \$341,498).

The State supports seven teachers-training colleges which in 1938-39 had a total student enrolment of 3,307 and a total instructional membership of 351, and received State appropriations amounting to \$910,250. It also supports the West Virginia university which in 1938-39 had an enrolment of 3,939, a total faculty membership of 268 (besides 64 assistants and the staffs of the Demonstration School, Library, Experiment Station, Extension, Military and Athletics) and a total income of \$2,428,488.

Banking and Finance.—On July 1, 1939, the total deposits of the 103 State banks and trust companies were \$132,063,704.11. The total deposits of the 78 national banks in the State were \$157,603,000.

The summarized finance statement of the State treasurer for the fiscal year 1938-39 is as follows:

Balance July 1, 1938	(all funds)	\$ 15,957,889.10
Receipts for 1938-39	{ (all funds) { (transfers)	95,734,772.22 43,236,531.93
Total		\$154,928,593.25
Disbursements, 1938-39	(all funds) (transfers)	\$100,051,729.93 43,236,531.93
Balance, July 30, 1939		\$ 11,640,331.39

On July 1, 1939, the total State funded indebtedness was \$78,612,000; the total amount of outstanding State road bonds was \$75,112,000.

The total assessed value of all property in 1939 was estimated at \$1,813,979,630 (real estate, \$837,104,169; personal property, \$382,419,461; public utilities, \$584,456,000). The Federal income tax in West Virginia for the fiscal year 1938-39 was \$13,585,757 (of which \$7,230,301 was from corporations, \$4,406,583 from individuals).

Industries.—In 1935 the oil production was 3,959,000 bbl. (which decreased to 3,847,000 bbl. in 1936 and 3,660,000 bbl. in 1937). In 1938 it was 3,724,750 bbl. and the natural gas production was about 150,000,000,000 cubic feet. In 1937 the coal production was 118,965,066 short tons and the coking operations produced an output of 276,778 tons. In 1935 the State had 1,042 industrial establishments, which employed 77,317 persons and paid \$80,105,045 in wages. These plants had a total production of about \$370,230,129—indicating a considerable decrease since 1929 but well above figures for 1931 and 1933.

Agriculture.—The acreage, production and value of the chief farm crops during 1938 were as follows:

	Acreage	Yield	Value
Corn	477,000	12,640,000 bu.	\$8,722,000
Wheat	156,000	2,340,000 bu.	1,732,000
Oats	86,000	1,806,000 bu.	777,000
Buckwheat	16,000	256,000 bu.	177,000
Hay	684,000	802,000 tons	8,100,000
Apples	3,227,000 bu.	2,258,000
Potatoes	32,000	2,720,000 bu.	2,176,000

The number of farms by census of 1934 was 104,747 (acreage of 9,424,655).

Wheat. The world's supply of wheat for the crop year 1939-40 is the largest on record, approximately 5,464,000,000 bu., compared to 5,225,000,000 bu. in the previous record year, 1938-39, and a ten-year annual average of 4,719,000,000 bushels. Production in 1939 was about 298,000,000 bu. less than the highest producing year, 1938, the year 1939 being second in the volume of production. A huge carry-over from 1938, plus a near-record 1939 crop, accounts for the all-time high in the accumulated supply. Figures herein do not include the two largest wheat producing countries, China first and Russia second. No reliable data on wheat production have been available from China and the U.S.S.R. for several years.

Estimated Wheat Production by Countries, 1936-39
(000 omitted)

	1936 bu.	1937 bu.	1938 bu.	1939 bu.

*Unofficial estimate.

Although the 1939-40 surplus of wheat was the heaviest of record, prices advanced spectacularly following the invasion of Poland by Germany September 1 and the declaration of war by Britain and France September 3. In the United States and Canada the maximum daily gains allowed by law were repeatedly exceeded and numerous changes governing trade in wheat were made by different Governments.

The Liverpool market was closed. Chicago, Winnipeg and the Argentine markets remained open. The U.S. Department of Agriculture suspended its export subsidy, instituted in August. The food defence department of the United Kingdom requisitioned all wheat stocks, and millers were licensed and authorized to produce straight-run flour of 70% extraction at fixed prices. Australia announced on September 14 the Government would requisition all commercial stocks of wheat and establish a compulsory marketing pool. Argentina on September 6 suspended the minimum

domestic price of 7 pesos per quintal. In Canada, the largest wheat-exporting country, with the 1939 crop being the heaviest since 1928, it was estimated that the available export supply would be 416,000,000bu., including the carry-over of 95,000,000bu. from 1938. The carry-over in the United States July 1, 1939, was 254,286,000bu., compared to 154,072,000bu. July 1, 1938. Export supplies were so large, especially in Canada and Argentina it was not considered likely that all export wheat would be moved the crop year, 1939-40, even under the stimulus of war prices. World disappearance of wheat was 4,025,000,000bu. in the crop year of 1938-39, and 3,810,000,000bu. the preceding year.

Up to the outbreak of war in September virtually all wheat exporting countries were struggling with huge surpluses and low prices, with Governments generally granting subsidies or regulating prices to aid producers. This situation developed from large increases in production in importing countries as well as in exporting countries.

In the 1920s, L. A. Wheeler of the U.S. Department of Agriculture points out, exporting countries normally produced about 750,000,000bu. of wheat for export annually, and importing countries ordinarily took that amount. In recent years, however, the total demand by the importing countries has been about 550,000,000bu. annually, while exporting countries have been producing about 900,000,000bu. for export yearly. England, Germany, and Italy have greatly increased home production of wheat by Government-guaranteed prices to farmers. At the same time consumption of wheat flour has decreased in these countries owing to governmental encouragement of the use of potato, rye, and corn flour as admixtures in wheat flour. Virtually all the smaller wheat importing countries have followed similar policies in increasing home production and decreasing consumption. France, a large producer, maintains a Government monopoly in wheat and fixes prices to encourage production, while discouraging imports with a tariff of about \$1.50 a bushel. (See L. A. Wheeler in *Foreign Agriculture*, U.S. Dept. of Agriculture, Jan. 1939.) (See also CEREALS; FLOUR AND FLOUR MILLING.) (S. O. R.)

Wild, Frank (1874-1939), British antarctic explorer, was born at Skelton, Yorkshire, England. At the age of 15 he joined an expedition to Australia. After 1901, when he joined the British National Antarctic expedition under Capt. Robert F. Scott aboard the "Discovery," Wild was a member of practically all important British explorative parties to the antarctic during the next 20 years. In 1908 and 1909 he accompanied Sir Ernest Shackleton in the small whaler "Nimrod," and in 1911-13 he was a member of Sir Douglas Mawson's Australian Antarctic expedition, for which he established and commanded the western base. He sailed with Shackleton again in 1914 with the Imperial Trans-Antarctic expedition aboard the "Endurance." After their ship was crushed and abandoned in Oct. 1915, the party drifted for almost six months on an ice-floe. When the floe broke up, the expedition separated, and Wild commanded 21 men who landed on Elephant island, where they remained under terrible hardships until they were rescued by Shackleton Aug. 30, 1916. Wild was second in command aboard the "Quest" on Shackleton's last expedition, which sailed in Sept. 1921. After

Shackleton's death on South Georgia island Jan. 5, 1922, Wild continued the expedition and obtained important sounding data. Upon his return he established his residence in South Africa. He died August 20, at Johannesburg.

Wild Life Conservation. The Federal Aid to Wild Life Restoration Act (50 Stat. 917), known also as the Pittman-Robertson Act, which became effective on July 1, 1938, seems destined to be of incalculable benefit to wild life. The act authorized operating appropriations of not to exceed the annual revenue from the 10% tax on sporting arms and ammunition. Collections from this tax for the fiscal year 1939, as far as figures are available, totalled \$2,976,019. Federal funds thus made available are apportioned to the States, under certain other conditions, on the basis of land area and hunting licences sold, and each State must contribute 25% of the cost of acquisition and development of land and water areas for wild life purposes and for research in the problems of management. All lands purchased are owned by the States and are to be maintained by them. The act requires the States to submit full information regarding their proposed wild life-restoration projects and, following approval by the Chief of the Bureau of Biological Survey, acting for the Secretary of the Interior¹, to complete them in an acceptable manner.

The initial appropriation to the Biological Survey was \$1,000,000; and for the fiscal year 1940 \$1,500,000 was appropriated. At

¹The Bureau of Biological Survey was transferred from the U.S. Department of Agriculture to the Department of the Interior, effective July 1, 1939, in accordance with the President's Reorganization Plan No. II, pursuant to the Reorganization Act of 1939.

HUNDREDS OF CROWS were shot in Feb. 1939 to provide the main course for a game conservation dinner in Grand Rapids, Michigan

the close of 1939 43 States had become eligible for participation, 42 of which submitted 187 projects. The types of projects were as varied as the problems of the State game departments, 72 involving research in wild life management, 71, development of natural conditions and 44, the acquisition of lands by purchase or lease.

Waterfowl Hunting Regulations.—Reductions in numbers of waterfowl, due to over-killing, drought and the general destruction of suitable habitat, threatened the extermination of certain species of ducks, and led four years ago to the adoption of stringent regulations, including the shortening of the open season to 30 days.

Curtailed annual kills, improved conditions on the northern breeding grounds, and the Federal refuge program were, however, believed to be responsible for an apparent increase, warranting a lengthening of the 1938 open season to 45 days.

Similar regulations were extended to the 1939 open season. The new regulations became effective when approved by the President on recommendation by the Secretary of the Interior.

Big-Game Preserves and Ranges.—Two new big-game ranges of outstanding importance, both in Arizona, were established by Executive order during 1939.

These are the Cabeza Prieta Game Range of 860,000ac., and the Kofa Game Refuge of 660,000ac., which are being administered by the Biological Survey in co-operation with the Grazing Service of the Department of the Interior. They were established primarily to protect the Gaillard bighorn sheep, but other species also receiving protection are the antelope, peccary, mule deer and Gambel's quail. (See also BIOLOGICAL SURVEY, U.S. BUREAU OF; BIRD REFUGES.) (E. A. G.)

Williams, Mrs. G. A. R.: see HEATH, LADY MARY.

Wilson, Clarence True (1872-1939), U.S. clergyman and prohibitionist, was born in Milton, Del. on April 24. He received his bachelor's degree from the University of Southern California in 1894, and continued his education at McClay college of theology, Los Angeles, San Joaquin Valley college, and St. John's college, Annapolis, Md., at each of which he received a degree. He first served as a Methodist minister at Seaford, Del., from 1889-91; later he occupied pulpits at Sea Cliff, L.I., Pasadena, San Diego, Newark and Portland. From 1910 until his death he was general secretary of the Methodist Board of Temperance, Prohibition and Public Morals. An ardent opponent of the sale and consumption of liquor, he also began a campaign in 1919 to prohibit the distribution of cigarettes to U.S. soldiers. He died at Portland, Ore., on February 16.

Wilson, Harry Leon (1867-1939), American author best known for his characters "Ma Pettengill" and "Ruggles of Red Gap," was born at Oregon, Ill., on May 1. He left school as a youth "to live his own life" and wandered to California, where he was occupied in miscellaneous jobs before he began contributing to the weekly *Puck*. In 1892 he was invited to become associate editor of this publication, and from 1896 to 1902 he was its editor. His first book, *Zig Zag Tales* (1896), was an indifferent success, but his second, *The Spenders* (1902) enabled him to resign his editorial position and travel for several years in Europe. Here he met Booth Tarkington, with whom he collaborated on *The Man From Home* (1908) and three other plays. He was elected to the National Institute of Arts and Letters in 1908. Among his later works of fiction were *Bunker Bean* (1912), *Ruggles of Red Gap* (1915), *Ma Pettengill* (1919), *Merton of the Movies* (1922), and *Two Black Sheep* (1931). He died June 28 at Monterey, Calif.

Windward Islands: see WEST INDIES, BRITISH.

Wines. The 1939 vintage in Europe will go down in the history of viticulture as a great disappointment, not so much from the standpoint of quantity as that of quality. The weather was generally unfavourable, July particularly being unusually cold, and in most sections accompanied by heavy rainfall and even by hail. It improved in spots in September and gave promise of fairly good wines, but broke again shortly after the beginning of the harvest and heavy rains fell almost every day during the vintage.

In France these conditions prevailed more or less throughout the country. The Burgundy district suffered perhaps even more than Bordeaux, the severe weather there resulting in a small as well as a poor crop. Champagnes likewise showed up badly. Bad weather resulted in a late harvest which produced a fair quantity but the wines are light and thin. As a result of these unfavourable climatic conditions, the grapes ripened unevenly, some remaining immature, others starting to rot before they could ripen.

Andalusia, in Southern Spain, where sherries are produced, apparently did not fare so badly although some of the vineyards were affected by the excessive cold of the early part of 1939. The weather was less unfavourable there during the summer and fall than in other parts of Europe, and the harvest was more abundant.

In Portugal cold, dry winds prevailed in July and August and prevented ripening of the grapes. Rain fell intermittently throughout the harvest period and the uneven development of the grapes resulted in an unsatisfactory vintage. The Madeira islands on the other hand report that the weather conditions in 1939 were not unfavourable and the vintage was generally satisfactory in both quantity and quality.

Italy, likewise, fared better, but even here there was too much rain.

In Alsace the 1939 vintage was fairly satisfactory in point of quantity but the quality leaves much to be desired.

Information regarding conditions on the Rhine and Moselle in Germany were not obtainable owing to the war, but it is to be assumed that the weather in the wine-growing districts of Germany was not much better than that which prevailed in the Alsatian vineyards, and that the vintage there, as elsewhere, will show 1939 as a poor year.

The Hungarian wine harvest was mediocre, the wines in the lowlands faring somewhat better, while the Tokays and other high-grade wines grown on the uplands suffered severely through the ravages of diseases of the vines and grapes.

In addition to the unfavourable weather conditions already referred to, practically all the important wine-growing countries of Europe have been labouring under the serious disadvantages caused by the war. Vineyard workers generally have been mobilized and the tasks usually performed by men of long training and experience had to be taken over by old men, women and children.

The reports from the United States of America are more encouraging. The harvests there, particularly in California, have been quite abundant and have kept pace with the increasing demand which has followed the extensive advertising campaign undertaken by the Wine Institute to make the American public wine-conscious.

The vintage in the wine-producing countries of the Southern Hemisphere,—Chile, the Argentine Republic, Australia and South Africa,—takes place in the early part of the year, corresponding climatically to the autumn of the Northern Hemisphere. The 1939 vintages appear to have been fairly satisfactory in both quality and quantity.

Since 1939—in European vineyards—was more or less of a failure, it becomes interesting to know how the wines of the previous year or two have developed. The 1937 European wine crops were generally abundant and unusually excellent in quality. The Bordeaux white wines are outstanding and the red wines, too, are very good. The burgundies, which in the beginning promised well, have lived fully up to expectations and will probably take their place among the great years.

The 1937 champagnes are full-bodied, have developed very well, and are expected to prove excellent when they have attained full maturity. The 1937 port wines show good colour, body and quality, and although not outstanding, will prove useful lodge wines. Alsatian wines as well as the German Rhine and Moselle wines in 1937 were excellent in quality and should prove worthy successors of the 1934s and 1929s.

The 1938 wines, on the other hand, were uneven and unsatisfactory practically all over Europe and will probably never enter seriously into consideration. It is the 1937 wines therefore that will have to be depended upon to maintain the supply for eventual requirements until a better harvest has been produced. (A. Wt.)

Wisconsin, the fifth and last State to be created under the Ordinance of 1787, is popularly known as the "Badger State." It has an area of 56,066 sq.mi., and the population in 1930 was 2,939,006. The capital is Madison, population 57,899; the largest city, Milwaukee, population 578,249. Urban population numbered 1,553,843, all whites except for 9,873 Negroes and 3,692 of other races. The rural population, 1,385,163, contained only 866 Negroes and 10,716 of other races, practically all Indians settled upon reservations. There were 386,213 foreign-born whites. In rural society native whites of native parentage constituted 44% of the whole, native whites of foreign parentage 40.5%. In the urban population, native whites of native parentage were 35.7%, those of foreign parentage 43.4%. The foreign-born made up 20.4% of urban, 14.8% of rural population.

History.—To understand the history of the year 1939 it is necessary to begin with the general election, Nov. 8, 1938. At that time the La Follette Progressive regime in Wisconsin, which had been in power most of the time for nearly 40 years, was overthrown by the Republican party, Julius P. Heil receiving a plurality of 187,000 for governor over Philip F. La Follette, candidate for a fourth term. Other State offices were also filled by the choice of Republican candidates; a Republican, Alexander Wiley, was elected to the United States Senate, and eight of the ten congressmen chosen were Republicans. That party also had majorities in both houses of the legislature, which made it certain that much of the recent Progressive legislation of a highly controversial character would be subject to repeal or modification.

Hygiene and Corrections.—A board of control which governed all penal and charitable institutions was among the boards and commissions which were abolished or reorganized under the authority of a Government reorganization law adopted by the 1937 legislature, at Governor La Follette's instance. Its functions were divided between a Department of Mental Hygiene and a Department of Corrections. By the legislature of 1939 these departments were abolished. Their duties devolved upon the Department of Public Welfare consisting of a seven-member policy-making board, a single director, and under him a head for each of six specified divisions, one of which is mental hygiene, another corrections. The Pension department and Public Welfare department also fall under the same authority. This includes old age, widows' and teachers' pensions; also phases of the relief administration.

The policy of changing the numerous commissions, usually of three persons having equal rank among whom administrative functions were divided, to a one-man directorship was carried out by the recent legislature in creating a department of research, a securities department, a department of agriculture and markets, a motor vehicle department, a department of taxation and several others, as well as the department of Public Welfare mentioned above. It is one of the major new movements and overthrows a policy in which Wisconsin had pioneered since the days of the elder La Follette.

The Wisconsin Development Authority, created by the 1937 legislature under conditions which were highly controversial, was designed to promote and aid in constructing municipal power facilities. A portion of its powers was shorn away by the effect of a supreme court decision handed down on June 21, 1938, leaving the Authority merely certain investigative and promotional functions. The legislature of 1939 abolished the Authority as a

public organ. It continues as a private incorporation designed to supply investigative knowledge and skill.

Agriculture, Manufacturing, Mining.—Wisconsin's agriculture centres in dairying. The product of her farms in 1936, including only crops, livestock and milk, was valued at \$347,000,000, about \$171,000,000 of which was credited to milk reckoned at farm price values. The comparable figures for 1937 were: crops and livestock, \$178,000,000; milk, \$178,000,000, or a total of \$356,000,000. For the year 1938 the returns under the same heads would seem to be approximately \$150,000,000 and \$144,000,000, or an aggregate production of \$294,000,000. Wisconsin leads all States in the production of cheese. Mining, a subsidiary interest, shows flurries of activity at present due to war prices of lead, zinc and copper, and there is always some iron production. Manufactures, which include lumber, paper and pulp, furniture and woodenware, farm machinery, engines, automobiles, electrical appliances, hospital equipment, etc., greatly exceed in value the State's agricultural productions. In 1935 Wisconsin stood tenth in value of manufactures, her aggregate product being valued at \$1,334,913,670. In 1937 the aggregate value of the product was \$1,772,310,417, or an increase of \$437,396,747 over 1935.

Labour Relations.—Wisconsin's workman's compensation law and her more recent unemployment compensation law have created widespread interest among the States. Labour legislation of 1937 consisted mainly in the creation of a Labor Relations Board. The legislature of 1939 abolished that board, creating as a substitute a Wisconsin Employment Relations Board with quasi-judicial powers but stripped of many of the investigational powers of the old board. It limits the definition of a labour dispute to one between an employer and a majority of his employees. It prohibits picketing when no such dispute exists. It bans secondary boycotts, sit-down strikes and strikes affecting perishable farm products, etc. The closed shop is permitted only when 75% of a bargaining group votes for it. Union labour vigorously opposed the law, while several farmers' organizations favoured it. The contest was peculiarly bitter and has left much ill feeling. The legislation is similar to that adopted in several other States which are under Republican rule, thus representing a general trend. (J. Sc.)

Wisconsin, University of. Enrolment (1939-40) remained at the high level set during preceding year, almost 11,400 students, continuing to be the largest resident enrolment in the 90-year history of the university.

The current building program consists of nine construction projects, most of which were either completed or nearing completion as 1939 came to a close. These projects include eight men's and five women's dormitory units, the third wing or theatre addition of the Memorial Union building, a law library, a cancer research laboratory and additions to the Chemistry and Biochemistry buildings and the heating station. The total estimated cost of this entire building program is approximately \$4,000,000, of which only \$148,500 was supplied by an appropriation from the general fund of the State. All of the building projects are scheduled to be completed during 1940. Several of them were completed and put into use during 1939, including the theatre addition to the Union building.

Very close to 2,000 young men and women received their first and higher degrees at the University's 86th commencement in June. This was the largest number ever to graduate from the University of Wisconsin in the school's 90-year history. (R. Fs.)

Woman's Christian Temperance Union.

The fact that more than 39,000 new women joined the organiza-

tion in 1939, that similar increases were made in the two branches, the Youth's Temperance Council and the Loyal Temperance Legion, is warrant that there is increasing interest in the organization's work. Nine hundred and eighty-five new unions were formed, which means almost a thousand new centres of organization to work out the objectives sought—total abstinence from alcoholic beverages, and the abolition of the liquor traffic. The fourth seminar on alcohol education sent additional trained specialist speakers into teachers' colleges. Two motion pictures are in circulation. These deal with the scientific, social and economic effects of alcohol. They are on high school and adult levels. Film strips for classroom use in the grades are available. These deal with health, safety and economics. Exhibits and many varieties of visual demonstrations, serial radio programs largely on safety, were but a few of the special releases of the year. The weekly magazine, *The Union Signal*—a journal of social welfare, and the *Young Crusader*, a children's paper, were increasingly added to libraries, both public and in the schools. Books and pamphlets have been printed in excess of any other year.

The national officers are: Mrs. Ida B. Wise Smith, president; Mrs. D. Leigh Colvin, vice-president; Mrs. Anna Marden DeYo, corresponding secretary; Mrs. Margaret C. Munns, treasurer; and Mrs. Nelle G. Burger, recording secretary. (I. B. W. S.)

Women's Clubs, General Federation of.

The General Federation of Women's Clubs was organized in New York city in the year 1890. Sixty-one clubs were represented. Today the Federation embraces 15,000 clubs with a membership of over 2,000,000 women, including 74 clubs in territories and 35 foreign countries. It is incorporated for \$1,500,000.

Among the programs given special emphasis in 1939 were: a "Good Neighbor" Tour, an imaginary visit to the other republics of the American continent; a Consumer Education program and a weekly consumer broadcast over a national network; a monthly radio forum on current questions of importance; the promotion of public health and public welfare; and a study of the problems of youth, particularly of education in a democracy. The year 1940 marks the 50th anniversary of the Federation, and many special programs have been developed for that Golden Jubilee. The work of the Federation is carried on largely through its nine departments—American Citizenship, American Home, Education, Fine Arts, International Relations, Junior Club Women, Legislation, Press and Publicity and Public Welfare, and through standing and special committees.

"Adjusting Democracy for Human Welfare," is the keynote of the present administration. The officers for the term 1938-41 are: Mrs. Saidie Orr Dunbar, president; Mrs. John L. Whitehurst, first vice-president; Mrs. LaFell Dickinson, second vice-president; Mrs. Horace B. Ritchie, recording secretary; Mrs. J. L. Blair Buck, treasurer. The Federation owns its headquarters, at 1734 N Street, N.W., Washington, D.C. (S. O. D.)

Wood, Henry Alexander Wise (1866-1939), U.S. inventor, was born in New York city on March 1, son of Fernando Wood, who was mayor of New York for three terms. He was educated at Media academy in Media, Pennsylvania. Wood early interested himself in the mechanical problems of printing newspapers and invented a machine for making printing plates that greatly increased the production speed of publishing large metropolitan dailies. In 1916 he announced a series of inventions that doubled the production of high-speed newspaper presses. Wood was also an accomplished aeronautical engineer and in 1915 served as a member of the U.S. Naval Consulting board. He was first president of the American

Society of Aeronautic Engineers. He founded the magazine *Flying* and was its editor from 1911 to 1919. After the armistice he helped organize the League for the Preservation of American Independence, which bitterly opposed President Wilson's efforts to secure the United States' entry into the League of Nations. At one time Wood accused the President of violating the constitution and urged his impeachment by Congress. He died at New York city on April 9.

Woods, Frederick Adams (1873-1939), U.S. biologist, was born January 29 at Boston. After studying for four years at the Massachusetts Institute of Technology he enrolled at Harvard, where he received a medical degree in 1898. For four years thereafter he taught histology and embryology at Harvard, and he was a lecturer in biology at M.I.T. from 1903 to 1923. Dr. Woods made many important contributions to the study of heredity and was a pioneer in historiometry—the science of applying exact mathematical or statistical methods to the study of history. He published *Mental and Moral Heredity in Royalty* (1906), *The Influence of Monarchs* (1913), and *Is War Diminishing?* (1915), the latter in collaboration with Alexander Baltzly. He died November 5 in his home at Rome.

Wool. Estimates of sheep in the world during 1939 were figured at 746,300,000, growing 3,710,000,000lb. of wool. The Australian clip was computed at 1,034,000,000lb.; South America, 616,000,000lb.; United States, 440,088,000lb. (including 65,000,000lb. pulled); New Zealand, 310,000,000lb.; Union of South Africa, 270,000,000 pounds. United States imports of apparel wool totalled 61,000,000lb. in the first nine months compared with 18,000,000lb. during the same months of 1938, when domestic mill consumption was at a low level, and an average of 62,000,000lb. for those months in the five years, 1933-37. The wool consumption for the year was estimated at 672,500,000 pounds. In Great Britain the annual consumption is about 710,000,000lb., although in 1939 wool for civilian consumption declined but was more than offset by large Government orders for war purposes. Germany consumes 420,000,000lb. annually, but with efficient regulation of civilian needs and substitution of rayon and staple fibre in 1939, it lessened its wool requirements by one-third. The annual wool consumption in France is 460,000,000 pounds. Japan's importations amounted to approximately 500,000 bales from Australia, New Zealand and Cape Colony.

World wool prices showed but little change during the first eight months of 1939 with 64s/70s on the London market, averaging 46.6 cents clean cost and U.S. territory fine staple 71.3 cents scoured basis. Domestic wool prices advanced 8 cents to 15 cents a pound, scoured basis, during the first week of September following the outbreak of the European war. The 1939-40 wool sales in Australia were cancelled on August 28 to be followed by an announcement on September 5 that the entire Australian and New Zealand clips would be purchased by the Government of the United Kingdom for the duration of the war and one year afterwards. The New York Wool Top Futures market advanced 160 points the first week in September, spot top advancing 13 cents. The Roubaix-Tourcoing Wool Top Futures market closed on August 31 and the Antwerp market on September 4. The high point in trading on the New York exchange occurred during the six trading days ending Monday, September 26, making a new weekly record of about 9,900,000lb. of wool top, with an advance of 352 points in the most active month. Fine staple wool advanced 32 cents a pound on the Boston market during that period to \$1.10. Manufacturers were obliged to price their fabrics from 40 cents to 50 cents a yard above their August quotations.

Due to heavy consumption of domestic grown fine wools and the

control of the Australian clip of similar grade by the British Government, the United States, commencing in September, purchased 50,000 bales of fine wool from Cape Colony, these wools not having been taken over by the British Wool Control Board. The British Government in September assumed full control of all stocks of wool in England. Maximum prices for all grades and types were established with every wool firm being required to file a return of its stock within five days. Requisitions for stock to be used for civilian purposes were necessary and licences were obtained for delivery.

The British Control Board announced that fine wools from Australia would be allocated to neutral countries for civilian needs. A joint committee, consisting of wool merchants and manufacturers, conferred in New York city with representatives of the British Government relative to the allocation of Australian wools to the United States. On December 1 press releases announced that 10,000,000lb. of wool were available for the United States; no price was named but it was specified that payments be made in dollars rather than in pence.

Sales of wool top on the New York Wool Top Exchange to December 1 were 109,100,000lb. compared with 69,540,000lb. for the same period in 1938. Wool sold through co-operative marketing associations during 1939 amounted to 70,000,000 pounds. At the close of the year the total stocks of domestic combing grease wool in the hands of dealers, co-operatives and growers was estimated at 30,000,000lb. in comparison with a normal carry-over of 150,007,000 pounds. The total amount, including foreign importations, was 259,000,000lb. in comparison with 341,000,000 in 1938. Imports of wool fabrics from England, to October 1, amounted to \$5,916,000; for the like period in 1938, \$3,200,000. (See also TEXTILE INDUSTRY.) (C. M. AN.)

Work Projects Administration: see SOCIAL SERVICE; WORKS PROGRESS ADMINISTRATION.

Works Progress Administration. (Renamed Work Projects Administration.) The outstanding developments in American work relief during 1939 resulted from changes in policy in the Emergency Relief Appropriation Act of 1939. Important characteristics of WPA were changed radically. A large number of WPA workers, both relief and administrative, had to be discharged.

The 1939 law wiped out the prevailing wage principle and required all WPA project workers to work 130 hours per month for their security wage (Sec. 15). This change brought WPA hourly rates considerably below those in private employment, particularly the wages of skilled workmen. Eligibility of aliens was also ended.

The new law also provided that after Aug. 31, 1939, the monthly earnings schedule for workers of the same type should not be varied "in different geographical areas to any greater extent than may be justified by differences in the cost of living." Under the previous schedules of maximum monthly earnings the WPA had taken cognizance of the fact that historically wages in private employment in different sections of the country have differed very substantially. Wages on the Pacific coast, in the east, north central States, and the middle Atlantic States, for instance, have been relatively high; those in the south-eastern and lower Mississippi valley States comparatively low. Under the new rule the long established sectional wage differentials have been disregarded; but the average labour cost per person of the Works Progress Administration remained substantially unchanged.

The Federal allowance of \$7 per month per worker for non-labour costs was cut in 1939 to \$6 per month with a proviso that more than \$6 but not more than \$7 could be allowed to meet increases in the costs of materials. The low allowance for materials

has been intended throughout the history of WPA to force the local governments to furnish most of the materials needed for WPA-aided State and local construction projects. The principle is sound but two facts have been revealed by experience: Insufficient supplies of materials and equipment have made it impossible to keep many WPA crews working steadily, forcing men to idle part of their time because of lack of materials, and the local governments, with the entire burden of outdoor relief on their hands, have in many cases found it impossible to provide adequate funds for WPA materials and equipment. The 1939 reduction of the allowance to \$6 has made it more difficult, therefore, for the poorer communities to finance their share of WPA costs (Sec. 1c).

Another important and closely related provision of the 1939 Act requires that not less than one-fourth of the total cost of non-Federal projects must be borne by the local governments (Sec. 1d). Moreover, no WPA funds can be used for Federal buildings costing over \$50,000 or non-Federal costing over \$52,000, unless the project was approved before July 1, 1939. This provision was intended to end the fear of private contractors that the WPA might cause Government buildings to be constructed by Government "force account" methods rather than through the letting of contracts to private firms.

The administrative appropriation was cut from 5% to 4% of the total WPA appropriation. The practical significance of this change has been two-fold. It has forced the dismissal of many administrative employees and increased the already indefensible amount of unpaid overtime worked by a large number of WPA administrative employees.

The New York Advisory Council recommended that, "There should be periodic separations and re-examinations of all workers to eliminate the establishment of a vested interest in work relief and to compel proof of continued eligibility." This was a concrete expression of the fear on the part of a good many citizens that a large number of people might remain indefinitely on work relief rather than seek private employment. Congress responded to this recommendation with a provision that there should "be removed from employment" on work projects "all relief workers, excepting veterans, who have been continuously employed on such projects for more than eighteen months" and that they could not be reinstated until after the expiration of 30 days and recertification of need by the relief authorities (Sec. 16b). The commissioner was also required to make periodic investigations to eliminate persons not in actual need; each person to be investigated at least once every six months (Sec. 16b).

The allegations that WPA employees were being solicited for contributions to political party campaign funds resulted in drastic provisions forbidding solicitation of such funds from persons paid from WPA funds. Such solicitation is defined as a felony and punishable by fines up to \$1,000 and imprisonment up to a year.

Table below shows employment on projects financed by WPA, 1938-39. The sharp decline in Aug. and Sept. 1939 was due to the heavy layoffs forced by the new law. In July 1939, there were laid off 342,157 and in August, 678,621. Total separations in

Employment on Projects Financed With WPA Funds, United States and Territories, by Month, 1938-1939

1938	Number Employed on Projects	1939	Number Employed on Projects
January 26	1,900,625	January 25	2,895,125
February 23	2,075,402	February 22	2,055,022
March 30	2,445,415	March 29	2,832,722
April 27	2,581,807	April 26	2,629,314
May 25	2,678,223	May 31	2,457,901
June 29	2,806,931	June 28	2,420,741
July 27	2,966,832	July 26	2,143,659
August 31	3,055,762	August 30	1,778,149
September 28	3,136,595	September 27	1,719,870
October 26	3,253,623	October 28	1,825,722
November 30	3,103,658	November 29	2,023,551
December 28	3,002,241	December	

July were 490,551 and in August 782,826. During the same months 131,979 and 292,897 persons were added to the rolls.

Wrestling was once a near-major sport in the United States, but every year since 1934 has seen the professional game on the wane. The late John Curley did much to build it up in New York and in a few Eastern cities, but the entertaining aspects of many of the contenders and the pseudo-championship contests billed in many States and cities have caused wrestling to lose both confidence and the interest of many sports fans. After being placed in disrepute when the New York State Athletic Commission and the New Jersey Commission refused to recognize the so-called champions, the sport slipped to further low levels of interest. A few professionals who consider themselves "world champions" in some States and cities are Bobby Bruns, Crusher

"THE ANGEL," a French wrestler born in Russia, had won more than 175 consecutive matches by 1939

Casey, Tom Casey, Abie Coleman, Rudy Dusek, Don Evans, The Great Gama, Maurice La Chappelle, Strangler Lewis, Jim Londos, Danno O'Mahoney, Gus Pesek, Jack Sherry, Gus Sonnenberg, Phil Thesz, Nagurski, Marshall and Gino Vagnone.

Interest in amateur wrestling under the direction and supervision of the Amateur Athletic Union is increasing and excellent progress is being made in practically every section of the United States. The national championships, promoted by the Pacific Association, attracted entries for nearly every district, with the team championship awarded to the New York A.C. In collegiate circles, wrestling flourished throughout the nation. Oklahoma A. and M. won the National Collegiate A.A. title. In the Eastern intercollegiate group, Lehigh once more went through the tourney successfully to win the championship. (J. B. P.)

Wright, Willard Huntington: see VAN DINE, S. S.

Wu Pei-fu (1873-1939), Chinese soldier and scholar. During the years after the World War he was the outstanding leader, "the only honest warlord" in North China. In 1922 he defeated Chang Tso-lin, overlord of Manchuria, but was himself defeated two years later near Tientsin and went into retirement to devote his time to writing and to study. In 1926 he returned to the wars to oppose the advancing forces of Chiang Kai-shek but was routed. Thereafter he remained in seclusion, and the Japanese tried without success to secure his support of a puppet regime in China after 1937. He died at Peiping on December 4. See *Encyclopædia Britannica*, vol. 23, p. 816.

Wyoming, a Rocky Mountain State, was admitted to the Union July 10, 1890, as the 44th State. Leadership in the extension of rights to women gave it the name "Equality State." Wyoming has a land area of 97,548 square miles. The State is second in average elevation with approximately 6,700 feet.

According to the 1930 Census, it had a population of 225,565. Of its population in 1930, 70,000, or 31% were urban; 214,067 were whites; 1,250 were Negroes; and 194,409 were born in the United States. The capital city, Cheyenne, in 1930 had a population of 17,361, and Casper had 16,619.

History.—Elective State officials in 1939 were, governor, Nels H. Smith (R.); secretary of State, Lester C. Hunt (D.); auditor, William Jack (D.); treasurer, Mart T. Christensen (R.); and superintendent of public instruction, Miss Esther Anderson (R.). The Republican party had a majority in both houses of the legislature and had control of administrative boards.

The 1939 legislature combined the State Planning board with the State Conservation board, and gave the new board power to make surveys of water, transportation needs, recreational facilities, soil, adaptability of various parts of the State for crops, range and recreation, mineral resources, possible improvement of the public service, and fish and game. The board is to recommend to the governor a definite program before the meeting of each session of the legislature.

In the 1939 legislative session an effort to remove the sales tax on foods and an effort by the Union Pacific and organized labour to require the use of coal instead of gas in public buildings failed. Preparations were begun in 1939 for celebrating the State's semi-centennial in 1940.

Education.—Wyoming has only one institution of higher learning, the State university at Laramie, which includes a college of liberal arts, a college of agriculture, a college of engineering, a college of education, a law school, a department of military science and tactics, a department of physical education and a division of music. The university enrolment for the school year 1939-40 included 2,044 regular students in residence. There was

a faculty of 160. High school attendance in the fall of 1939 was 14,939.

Mineral Production, Ranching, Manufactures, Agriculture.—Mineral production ranked first in 1939 with a total value of more than \$150,000,000, using the refined prices for petroleum. Wyoming oil wells produced 23,000,000 bbl. of crude oil. Coal production was 5,600,000 tons; iron ore, 800,000 tons; and bentonite production was valued at \$1,000,000. During the summer of 1939 the Utah Refining Company constructed a 438-mi. pipe line to carry oil from Ft. Laramie, Wyoming, to Salt Lake City, Utah, for refining.

Live stock production was second with a value of \$34,000,000. Wyoming cattle sold for \$16,000,000; sheep, for \$9,500,000; wool, for \$7,903,680; and hogs, for \$600,000. More cattle and sheep than usual were sold because drought conditions in many parts of the State in the latter half of 1939 made disposal of stock imperative. The cattle population declined from 1,000,000 to 750,000.

Manufacturing, excluding oil refining and dairying, produced goods valued at \$25,000,000. Principal products were timber products, metal products, souvenirs, beverages and sugar.

Hay, as usual, was the State's most valuable crop. Value of the hay crop was \$6,335,600. The sugar beet crop brought \$2,673,000. The edible bean crop was valued at \$1,476,280. Corn brought \$1,075,760. Potatoes were valued at \$1,022,560.

Recreation.—It is estimated that 350,000 tourists visited Wyoming in 1939 and spent \$25,000,000 in the State. Hunting and fishing were popular. Lack of snow in the fall of 1939 made big-game hunting more difficult and also limited opportunities for skiing.

(A. T. L.)

X-Ray. Important advance was made during 1939 in knowledge of the anatomy and physiology of the heart and great blood vessels and in the diagnosis of disease of the circulatory organs by means of a new method of visualization of the heart and great blood vessels.

The method is the result of research carried out by Robb and Steinberg at the New York University College of Medicine and the Third Medical division of Bellevue hospital. It depends on the injection of 25c.c. to 45c.c. of a 70% solution of diodrast into one of the large veins of the arm and the making of roentgenograms when the chambers of the heart and the blood vessels are opaque to the X-ray. Diodrast is an organic compound of iodine. It depends upon its iodine content for its density and consequent resistance to the passage of X-ray.

The originators of the method have demonstrated that the following structures became visible on the roentgenogram:—the superior vena cava and its tributaries, the four chambers of the heart, the ventricular walls and the interventricular septum, the tricuspid, pulmonic and aortic valves, pulmonic and aortic sinuses, the pulmonary artery and the entire thoracic aorta including its wall and the branches from the arch.

The method appears to be safe and practical and in addition to opening up a new field for investigation of the anatomy and physiology of the heart and blood vessels it also affords means of diagnosis of various diseases of the circulation, which may become very important. It not only has direct value, but the knowledge that it gives of the exact location and configuration of the heart chambers and the position, size, course and relations of the great blood vessels will make it possible to interpret the findings of conventional roentgenoscopy and roentgenography much more fully and accurately than hitherto has been the case. Wm. H. Stewart working with Robb and Steinberg has extended the method just described to the production of moving pictures of the roentgenoscopic image of the heart and blood vessels. By this

MILLION-VOLT X-RAY MACHINE as it was being assembled in Jan. 1939 at Schenectady, New York

indirect method of cine-roentgenography one may see the opaque blood stream passing through the pulmonary blood vessels, the chambers of the heart and the aorta.

Reports were made during 1939 on the continued use of the method of body section roentgenography variously known as planigraphy, tomography, etc. The value of this method apparently is established, especially in lesions of the larynx, chest, temporo-mandibular joint and the ethmoidal and sphenoidal sinuses. The apparatus for tomography has been greatly simplified so as to render it inexpensive and readily adaptable to any efficient X-ray installation. The rotating anode tube is now an established part of X-ray equipment. The superiority of roentgenograms made with this type of tube over those obtainable with any other type has been fully demonstrated. There are indications that the tube can be simplified and constructed for use even on small machines.

The complete integration of radiology into medical practice is indicated by publication of many articles in journals devoted to general medicine or to one of the specialties which deal with the use of the X-ray in conjunction with other methods for diagnosis of disease. An instance of this is the combined use of the X-ray and the new method of gastroscopy for the diagnosis of disease of the stomach. Greater accuracy is assured in the diagnosis of gastritis and in the differentiation of localized gastritis and cancer and of cancer and ulcer by the combined use of these methods than can be had by either alone. (See also HEART AND HEART DISEASES; RADIOLOGY; STERILIZATION; TUBERCULOSIS.)

(A. C. CH.)

THE "WAKIVA," a 69ft. yawl, was first across the finish line of the Miami-Nassau race Feb. 14-15, 1939, but the race was won by "Stormy Weather"

Yachting. The outstanding event of 1939 was the Honolulu race which started from San Francisco on July 4. A record list of 26 starters took part in the event with light and changeable winds predominating. An eastern yacht, Richard J. Reynolds' cutter "Blitzen," joined a fine fleet of Pacific coast vessels in the contest and emerged the winner. Harold Judson's cutter "Jorie" and A. L. Marsten's yawl "Brilliant" were second and third respectively. On the Atlantic coast several events during the last two weeks of June unfortunately competed for entries among the growing fleet of cruising and ocean racing craft. The New York Yacht club's race from Newport to Cape May and back to Montauk Point was taken by R. J. Schaefer's big yawl "Edlu." The Annapolis Yacht club's race from New London to Annapolis was won by a dark horse, E. S. Bradford's Alden-designed yawl "Estrella." Only a few hours earlier R. O. H. Hill's little "Lucky Star," a stock auxiliary, had been declared winner in a fleet of over 30 yachts competing in the Eastern Yacht club's annual race from New London to Marblehead.

The long distance classics of the Great Lakes, the Port Huron-Mackinac and Chicago-Mackinac races both attracted record lists, some of the contestants coming from as far afield as Long Island Sound. James R. Lowe's big yawl "Manitou" won the Lake Huron event while the Chicago affair was taken by a nine-year-old sloop, E. B. Lombard's Rhodes-designed "Bangalore" in the cruising division and A. Herrman's "Gloriant" in the racing class.

The outstanding ocean racing yacht of 1939 was unquestionably the 53-ft. yawl "Tioga Too," designed by John G. Alden for Harry K. and E. Pike Noyes. Her young owners campaigned her most extensively throughout the season, doing exceptionally well against the comparatively small but choice fleets of the Eastern and New York Yacht club cruises and taking prizes in many of

the less famous events for yachts of her type. Her season was climaxed when she led the fleet into Halifax and won by over 12 hours a fog-ridden race which was started at Marblehead, Mass., and was held jointly by the Boston Yacht club and the Royal Nova Scotia Yacht Squadron.

Although even the Star Class International Championship was held in Germany in 1939, the total lack of foreign competition caused no slackening of interest in small boat racing. The traditional race weeks at Larchmont and Marblehead attracted near record entry lists while events on Chesapeake bay, at various centres on the Great Lakes, on the Pacific coast, at Edgartown, Mass., and other centres showed greatly increased interest.

One of the notable yachts of the year was the 12-metre "Vim" designed for Harold S. Vanderbilt by Sparkman and Stephens, Inc. Her model, of course, was tank tested and she was fitted with countless gadgets, a duralumin mast, rod rigging and other refinements, some proven, others experimental.

Among the significant developments of the year were the building of three identical ocean racing yawls to the Cruising Club of America's rule by the U.S. Navy for the use and training of midshipmen at Annapolis. These were designed by A. E. Luders, Jr., and are worthy additions to the navy's growing fleet of sailing craft. Other interesting developments were the rapidly increasing use of radio direction finders and radio telephone equipment on yachts and widening uses of waterproof plywood in hull construction. Small boats built almost entirely of plywood are beginning to appear.

Europe.—In Britain and, in fact, throughout the whole European yachting scene, the most important single event was the visit of America's outstanding racing skipper, Harold S. Vanderbilt, with his new 12-metre "Vim." Four new yachts were built to meet her, the "Tomahawk," "Jenetta," "Ornsay" and "Flica II" which with "Trivia" and "Evaive," new in 1938, made up as fine a fleet of large racing yachts as has been seen anywhere in a decade. "Vim" sailed 28 races in two months and won 19 first prizes, four seconds and three thirds. T. O. M. Sopwith, Vanderbilt's competitor in the last two matches for the America's Cup, had the second best record of the season. His "Tomahawk" scored six firsts, 10 seconds and five thirds, in 27 starts up to August 9.

The match among six-metres for the Scandinavian Gold Cup, premier small boat trophy of the world, was sailed in 1939 in Finnish waters, the right to defend it at home having been relinquished by the Seawanhaka-Corinthian Yacht club of Long Island. "Goose," winner in 1938, was taken over to defend by her owner, George Nichols, who had the misfortune to fall ill on his arrival in Helsingfors. His son, George Nichols, Jr., however, stepped into the helmsman's cockpit and won three straight races and the cup, defeating seven other "sixes."

Among the other outstanding six-metre events in European waters was the winning of the One Ton Cup by the "Noreg III," owned by Rolf Svinndal and Crown Prince Olaf of Norway. "Noreg III" challenged for the Seawanhaka Cup, but was defeated by J. H. Thom's "Circe," three races to two, in a series sailed on the Clyde.

The long ocean race for the Fastnet Cup was the fastest and one of the best ever sailed. The winner was Isaac Bell's yawl "Bloodhound." The Dutch "Zeearend," the 1938 winner, was second, and the German "Roland von Bremen" was third.

The International Championship of the Star class was held at Kiel in late August under war clouds. Walter von Huchler retained his title with the famous "Pimm." The Italian "Polluce" was second, the German navy's "Muggel" third. (H. L. St.)

Yale University. The close of the academic year 1938-39 marked the end of the first decade of the

Institute of Human Relations. After a careful survey of its accomplishments and its future possibilities the Rockefeller Foundation voted a sum of \$700,000 toward its support for a second period of ten years. The Foundation has also provided \$300,000 for the Department of Psychiatry and Mental Hygiene and the Psychiatric Clinic, and \$85,000 toward the support of the Clinic of Child Development. The Carnegie Corporation has appropriated \$30,000 for the latter clinic. The Laboratories of Primate Biology have been refinanced by the Rockefeller Foundation by an appropriation of \$189,000 over a five-year period and a gift of \$35,000 for the erection of a new physiological laboratory at Orange Park, Fla. Gifts and bequests received by the university during the year ending June 30, 1939, totalled \$4,209,486; gross additions to funds were \$3,819,706, including interest on certain funds; total endowment and reserves are (1940) \$108,718,094, with a net after investment losses of \$100,448,707. In addition, the Sheffield Scientific school trustees have assets of a book value of \$2,038,397.

Outstanding new appointments for the year were: Professor Samuel J. Record, dean of the School of Forestry, succeeding Henry S. Graves, retired; Henri M. Peyre, Sterling professor of French; Professor Ashbel G. Gulliver, acting dean of the School of Law; Richmond Carter Nyman, personnel director.

Yankee Clipper: see UNITED STATES: Aviation.

Yarnell, Harry Ervin (1875-), American naval officer, attained renown in 1938 and 1939 for his repeated refusals to yield before Japanese attempts to curb American commercial and naval privileges in China. He was born October 18 at Independence, Ia., and graduated from the U.S. Naval academy (1897) and from the Naval War college (1915). He was commissioned ensign in 1899 and promoted until he received the rank of rear admiral Aug. 17, 1928. During the Spanish-American war he served on the U.S.S. "Oregon"; he participated also in the Philippine insurrection and the Boxer uprising, and in the occupation of Veracruz in 1914. He was on patrol duty at Gibraltar in command of the U.S.S. "Nashville" during the World War and in 1918 was on the staff of Admiral William S. Sims in London. In 1928 he was appointed chief of the Naval Bureau of Engineering, in 1931 commander of the aircraft squadrons of the battle fleet, and in 1933 commandant of the Pearl Harbor naval station in Hawaii. He was advanced to commander-in-chief of the U.S. Asiatic fleet in 1936 and held this position until he was succeeded by Admiral T. C. Hart in 1939. Upon his retirement, Congress voted him a Distinguished Service Medal.

Yeats, William Butler (1865-1939), Irish playwright and poet, was born at Sandymount, near Dublin, on June 13 and received his early education there and in London. A biography and a critical appreciation of his work appear in *Encyclopædia Britannica*, vol. 23, p. 882. After a period as an art student, he decided at the age of 21 to devote his entire time to writing and to the Irish literary renaissance, then beginning to take form. He was one of the original founders, with Lady Gregory and others, of the Irish Literary Theatre, which established itself in the Abbey theatre in 1904. In 1923 he received the Nobel prize for literature. Among his better known plays are *Kathleen ni Houlikan*, *The Pot of Broth*, *The Hour Glass* and *Deirdre*—all written for performance at the Abbey theatre. His simple, mystic lyrics and his elaborate verse plays are testimony to his poetical versatility. His later work included *Dramatis Personae* (1936), an autobiography; *Words for Music, perhaps* (1932), *Wheels and Butterflies* (1934), *Full Moon in March* (1935), and *Essays* by W. B. Yeats (1938). On Yeats's 70th birthday, in 1935, John Masefield, the poet laureate,

called him "the greatest living poet." Yeats died at Roquebrune on the French Riviera January 28.

Young Men's Christian Association.

The World's Alliance of Young Men's Christian Associations was formed in 1855. It is composed of 36 autonomous national alliances and associations in 28 other countries affiliated informally. The headquarters of its world's committee and executive are located at Geneva, Switzerland. Its 21st world's conference met in Mysore, India, in Jan. 1937. A World's Young Men's Conference met at Amsterdam, following the World Conference of Christian Youth in June 1939. Reports from all countries (Jan. 1, 1939) showed 10,500 associations with 1,960,226 members, predominantly young men and boys. A body of secretaries or professional workers numbering 6,002 was reported. Concerns of immediate importance to the alliance include the menace of war, participation in direct war-service by various national alliances, and preparations for service to war-prisoners under World's Alliance auspices; the contribution of Christian youth to a Christian world order; public questions affecting the place and opportunity of youth; and the emergence of a universal Christian community. Publications: *Youth in the New World*, *Flaming Milestone*, *World's Youth*, a quarterly journal, are published by the World's Committee, Y.M.C.A., Geneva; *Y.M.C.A. Year Book for 1939*, National Council, Y.M.C.A., New York. (O. E. P.)

Young Men's Hebrew Association and Young Women's Hebrew Association: see JEWISH WELFARE BOARD.

Young Women's Christian Association.

The year 1939 marked for the Young Women's Christian Association in the U.S.A. a period of increased service to women and girls at home as well as of intense concern for the needs of their suffering sisters in war-stricken countries. The recreation, education and fellowship programs of the more than 1,500 local centres were participated in by nearly 3,000,000 women and girls. Eighteen summer conferences were held for the various constituent groups, such as business girls, industrial girls, Girl Reserves and students, directed toward the developing of more effective citizens. Summer schools and institutes were also held for training leadership. Of particular importance were the 10 regional conferences held in various sections of the country for the purpose of making possible during the interim year between national conventions discussion of Association interests in more homogeneous groups. The total attendance at these conferences was 3,184. An important service in 1939 was the assistance given to local Y.W.C.A.'s, through the organizing of a National Y.W.C.A. Committee on Refugees, in educating public opinion on this subject. In the summer of 1939, 176 Y.W.C.A. representatives from 27 countries attended the World Conference of Christian Youth at Amsterdam, Holland.

Fifty-three countries are related to the World's Y.W.C.A., headquarters at Geneva, Switzerland. In 1939 it continued to raise special funds for China to help the Association there meet the many emergency needs as well as carry on its normal program. In addition, financial assistance was rendered to Associations in several European countries facing crises because of the war situation. (M. S. Ss.)

Youth Movements are an organized effort at political, cultural, and social self-expression of

young peoples. In totalitarian States these youth movements are strictly regimented and made completely subservient to the aims of the State. In Germany an ordinance on April 5, 1939, established the all-inclusive conscription of all boys and girls between 10 and 18 years old for service in the Hitler Youth which took exclusive charge of the physical, mental and moral education of the entire German youth. Thus voluntary membership was abrogated, and service in the Hitler Youth became as compulsory as service in the labour army and in the military forces. Before the issuing of this ordinance it was estimated that of the about 11,750,000 young people in Germany from 10 to 18 about 7,000,000 belonged to the Hitler Youth. All other youth organizations, including Catholic organizations, have been long abolished.

A similar organization of the Italian youth was carried through in Italy concurrently with the general reform of the Italian educational system according to the plans of the minister of education, Giuseppe Bottai. In the Soviet Union the Communist youth organizations remain on a voluntary basis.

The International Socialist Youth Movement met for its sixth congress in Lille, France, and discussed the problem of peace, of the struggle for democracy and of protection for the working class youth. The movement unites 64 organizations in 28 countries with 287,929 members.

The American Youth Congress met in New York at the beginning of July 1939. Its session was very much troubled by violent discussion of the so-called "ism"-issue. A compromise resolution condemning all dictatorships was accepted, and the official creed adopted by the Congress concluded with a formal pledge to the flag of the United States. The subsequent development in the foreign policy of the Soviet Union and the new attitude of the Communist Party against the popular front-co-operation with liberal and progressive forces caused an increase in the anti-communist feeling in the American youth movement. The congressional committee for the investigation of un-American activities, headed by Representative Martin Dies, examined the American Youth Congress for alleged communist influence and "fellow-travellership." The annual convention of the American Student Union in Dec. 1939 at Madison, Wisconsin, defeated a resolution condemning the action of the Soviet Union against Finland. (See also SALVATION ARMY.) (H. Ko.)

Yugoslavia, area 95,558 sq.mi.; pop. (est. Dec. 30, 1939) 15,703,000. Chief towns (pop. census 1931): Belgrade (cap. 266,849); Zagreb (185,581); Subotica (100,058); Sarajevo (78,173); Skopje (68,334). Ruler, King Peter II; premier, M. Tsvetković; languages, Serbo-Croatian and Slovene the chief; religion, Serbian Orthodox 48.70%; Roman Catholic 37.45%; Mohammedan 11.20%.

History.—Although at the elections of Dec. 1938 the electoral system had given the Government a large majority of seats in the chamber (306 to 67 Opposition), the voting had been close (1,643,783 to 1,364,524). Many of the Government party themselves felt the necessity of a new policy, and when early in February one member of the Government made a very strongly Pan-Serb speech five of his colleagues resigned. On February 4 the Government was reconstructed with M. Tsvetković, one of the five dissidents, as premier in place of M. Stoyadinović. It was at once announced that the Government meant to solve the Croat question; it was understood also that it hoped to return to more constitutional methods. Serbo-Croat negotiations began at once, but many difficulties arose, including that of delimiting the Serb and Croat areas. On April 27 it was announced that agreement had been reached, but later stated that the prince regent had refused his consent to the agreement, which included provision for a representative government of concentration. Only on August 25,

after feeling had risen very high, were fresh proposals sanctioned. A new Government was now formed, including five members of the Government party, five representatives of the Croat party, and three of the Serb opposition. M. Tsvetković remained premier and M. Cincár-Marković foreign minister. The two Croat Banovinas, with seven adjacent districts, amounting to 20% of the area of Yugoslavia, with a population of 4,423,000, of whom 3,052,000 were Croats and 360,000 Serbs, were formed into a new Banovina under a Croat Ban (appointed and dismissible by the crown), and with its own diet at Zagreb. The Banovina enjoyed very wide autonomy, but foreign affairs, defence, foreign trade, public security, religion, commerce, transport, mining, weights and measures and general educational policy were reserved to the central authorities. The first Ban was M. Šubašić. Parliament was dissolved and the Government empowered to hold new elections. The agreement was hailed with very wide-spread enthusiasm, although it left many questions to the future: the organization of a Slovene Banovina, the position of the Vojvodina, Montenegro, Macedonia, and above all of Bosnia and Hercegovina, a bone of contention among Serbs, Croats and Moslems. These problems had not been solved by the end of the year, although the organization of the Croat Banovina itself had proceeded apace. The only elections held (November 12) were for the senate. The official candidates were elected unopposed in each Banovina, except that of Zeta (Montenegro).

Foreign Policy.—In February it was stated that foreign policy would be unchanged, but the departure of M. Stoyadinović was generally interpreted as meaning less enthusiasm for Germany and more for the democracies. Visits were, however, exchanged between the Yugoslav and Italian foreign ministers, and Italy's occupation of Albania was taken quietly. Yugoslavia continued efforts to reconcile Bulgaria and to mediate between Rumania and Bulgaria, and also between Rumania and Hungary, with whom her relations improved remarkably. On the outbreak of the war she declared her intention to remain neutral. (N. MAC.)

Education.—In 1937-38: elementary schools 8,727; scholars 1,393,422; secondary schools 320; scholars 156,287; universities 3; number of students 16,207.

Banking and Finance.—In dinars: revenue, ordinary (est. 1939-40), 12,947,000,000; expenditure, ordinary (est. 1939-40), 12,947,000,000; public debt (March 31, 1939), 24,620,000,000; notes in circulation (Sept. 30, 1939), 9,107,973,000; gold reserve (Sept. 30, 1939), 1,986,836,888; exchange rate (Aug. 1939): 190.00-207.56 dinars=£1 sterling.

Trade and Communication.—Foreign trade 1938 (merchandise): imports 4,975,341,932 dinars; exports 5,047,433,484 dinars; imports (Jan.-Aug. 1938) 3,455,900,000 dinars; imports (Jan.-Aug. 1939) 3,382,800,000 dinars; exports (Jan.-Aug. 1938) 3,132,200,000 dinars; exports (Jan.-Aug. 1939) 3,416,600,000 dinars. Communications 1938: roads, State 6,374mi.; other roads 19,671mi.; railways, open to traffic 6,591mi.; aviation: passengers 7,600; goods and luggage carried 137,906 kilograms; motor vehicles licensed: cars 13,561; trucks, buses, etc., 5,229; cycles 7,661.

Agriculture, Manufactures, Mineral Production.—Production 1938 (metric tons): maize 4,755,873; (1939) 3,694,200; wheat 3,029,937; (1939) 2,869,200; potatoes 1,701,672; beet sugar 557,444; barley 421,259; (1939) 433,600; oats 326,726; (1939) 346,200; rye 227,102; (1939) 244,800; bauxite (crude ore) 406,368; coal 450,412; lignite 5,286,781; iron ore (metal content) 300,000; pig-iron and ferro-alloys 58,457; steel 220,000; copper (raw) 41,993; wine 4,672,157 hectolitres; silver 78,509 kilograms; gold 2,436 kilograms; hemp 55,399; tobacco 15,847; flax (fibre) 12,917; wool 15,200; chrome ore (chromic oxide content) 28,000; antimony ore (metal content) 3,670; lead (refined) 8,646; zinc (raw) 4,642.

Labour.—Index of employment (average 1929=100) (average 1938) 121.70; (July 31, 1939) 128.20; unemployed, registered (average 1938) 22,517; (Aug. 31, 1939) 15,952. (See also BALKAN ENTENTE; EUROPEAN WAR; LITTLE ENTENTE.)

(W. H. Wn.)

Yukon Territory, the most westerly of the northern territories of Canada, was created a separate territory in June 1898, by Act of Parliament (the Yukon Act). It has a total area of 207,076 sq.mi., and a population of 4,000 (estimate, Dominion Bureau of Statistics, 1935). At the height of the gold mining boom (1901) the population was 27,219. The seat of government is Dawson.

By amending legislation provision has been made for a local Government composed of a chief executive, the controller, and an elective legislative council of these members with a three year tenure of office. The controller administers the government of the territory under instructions from the governor-general-in-council.

Mining is the chief industry, closely followed by trapping, and some fishing. In 1936 the Yukon (together with the Northwest Territories) produced 50,344 fine ounces of gold, 1,053,733 of silver and over 40,000 fur pelts.

(J. T. C.)

Zanzibar and Pemba: see BRITISH EAST AFRICA.

Zemgals, Gustav (1871-1939), Latvian statesman who was president of the republic from 1927 to 1930, was born in Courland, then a part of Czarist Russia, on August 12. Educated at Riga and Moscow, he became a well-known lawyer in the former city. He proclaimed the independence of Latvia on Nov. 18, 1918, and was elected president on April 8, 1927, to succeed Jan Tschakste. See his biography in *Encyclopædia Britannica*, vol. 23, p. 942. He died January 7 at Riga.

Zinc. Of the current world zinc output, one-half of the producing countries account for 90% of the total, and the other half for 10%. The details for the major countries are shown in the accompanying table.

World Production of Zinc
(In thousands of metric tons)

	1929	1932	1936	1937	1938
Australia	50.8	53.7	70.6	70.9	70.9
Belgium	197.9	96.3	195.3	225.6	210.0
Canada	78.1	78.2	137.6	143.9	155.7
France	91.6	49.3	53.6	60.4	62.2
Germany	102.0	42.0	136.4	163.3	192.5
Norway	6.4	40.1	45.0	41.3	46.5
Poland	169.0	85.0	94.3	109.3	108.0
U.S.S.R.	3.4	13.7	65.0	70.0	80.0
United States	573.0	193.7	474.6	534.9	414.6
United Kingdom	59.2	27.3	61.8	63.1	56.2
World Total	1,472.8	789.9	1,489.3	1,607.9	1,589.3
Ex. U.S.	899.8	596.2	1,014.7	1,127.8	1,167.0

World zinc output dropped by 5% in 1938, to a total of 1,589,300 metric tons, the decrease being chiefly in the United States and Belgium, partially offset by increases in Germany, Canada and Russia.

Production during the first half of 1939 was back almost to the 1937 level, with increases in the United States, Canada and Germany somewhat more than balanced by decreases elsewhere.

Primary zinc production in the United States in 1938 decreased by 20%, to 446,300 short tons, 2% of which was from foreign ores; 79% was distilled zinc and 21% electrolytic; in addition there was a recovery of 112,000 tons of secondary zinc, although not all of this was in metallic form. Preliminary estimates for the 11

months of 1939 indicate an output of 538,000 short tons in 1939, an increase of 18% over the 1938 rate.

The zinc industry in the United States has been practically self-contained, exports and imports being negligibly small, but a reduction in tariff of \$6 per ton of zinc in ore, and \$7 per ton of slab zinc, effective Jan. 1, 1939, increased the consumption of foreign zinc in 1939 to about 15% of the total.

British Empire zinc ore production centres in Australia, Canada, Newfoundland and Burma; Northern Rhodesia has a small output, and Great Britain still less, though the latter's metal production is increased by the smelting of Australian ores. Empire production of zinc in ore is 29% of the world total, but the metal production is only 18%, due to the exportation of Empire ores to other countries. The distribution of ore and metal production in 1938 was as follows, in long tons:

	Zinc Content of Ore	Smelter Output of Metal
United Kingdom	11,500	55,000
Northern Rhodesia	12,500	10,200
Canada	185,000	153,500
Newfoundland	65,900	...
Burma	54,900	...
Australia	219,800	69,600
Total	549,600	289,500

(See also METALLURGY.)

(G. A. Ro.)

Zog 1 (1895-), former king of Albania. Ahmed Beg Mati, or Zogu, was born on October 8, in Albania, and was educated at the Military Academy, Constantinople. For his early career, see *Encyclopædia Britannica*, vol. 23, p. 960.

On April 27, 1938, King Zog, the only Moslem monarch in Europe, married at Tirana the Hungarian Countess Geraldine Apponyi, a Catholic; the Italian Government was represented at the wedding by the foreign minister, Count Ciano. On April 5, 1939, Zog's son and heir, the crown prince Skander, was born at Tirana. Two days later the public rejoicing was abruptly terminated by the Italian invasion of Albania. On April 8 Zog fled the country and joined the queen and her three-day-old son in Greece. Later he and his family and retinue went to Istanbul, whence he addressed a futile letter of protest to the League of Nations. From here they travelled to Bucharest, then to Sweden, and in June rented a villa at Versailles, France.

Zoological Gardens. Dr. Mann of the National Zoological park at Washington took back emus from the London zoo, and sent in exchange rare North American birds and a cacomistle or ring-tailed cat. The New York zoo acquired a "tygon," a cross between a Siberian tiger and an African lion. At the Brooklyn zoo, an elephant hurled himself into a moat in which his mate was killed, but was hauled out safely.

Great Britain.—Before war started, gate receipts at the London zoo increased by £7,000, due largely to the presence of Ming, the hairy giant panda. When war began, the zoo closed for ten days, Ming and other valuable animals were evacuated to Whipsnade, the aquarium was emptied and poisonous snakes killed. Valuable records were sent to Woburn Abbey and the staff drastically cut. An adoption scheme was initiated, resulting, by the middle of December, in the adoption by animal lovers of 150 animals. Sung, the giant panda, died in December. Mr. D. Seth-Smith, known to thousands of children as a broadcaster, is to retire.

Whipsnade zoo also closed at the outbreak of war for a week and again on November 1, for four months, partly to develop waste land for growing food for the animals.

At Dudley, Mrs. John Vinden presented tropical fish. Surplus stock was sold when war came and arrangements made for killing animals in the event of release as a result of air-raids. At Bristol, two polar bears were shot and their dens made into shelters; the

aquarium was emptied. The Belle Vue gardens at Manchester were closed and so was Primley zoo, at Paignton, whose owner, Mr. Whitley, presented much of his stock to the London zoo.

Mr. Partridge presented a collection of birds to the Chester zoo and an adoption scheme was begun. All wild animals at the Kursaal zoo, Southend-on-Sea, were destroyed and Chessington zoo arranged for wild animals to be shot in an emergency.

In May, the Glasgow Zoological Society bought Calder Park estate for a zoo. At Edinburgh, dens were strengthened with concrete and sand-bags to withstand possible air-raids.

Many animals were evacuated to Dublin zoo, which also received African snakes from Lieut. Col. O'Doherty.

Europe.—Moscow Zoological park celebrated its 75th anniversary. Two young chimpanzees, sent from London, were exchanged for a snow-leopard. Copenhagen zoo, Denmark, closed for an outbreak of foot-and-mouth disease in March.

The Paris zoo closed when war broke out and valuable animals, including a giant panda and aquarium specimens, were evacuated to safer French zoos.

In Germany, elephants, camels, yaks, and oxen were impounded by the Government, to act as draught animals. Carnivores in the Hamburg zoo were destroyed, but at Munich less valuable animals were fed to the others, in the hope that the most valuable will survive the war. At Dresden, the dens of slaughtered carnivores were turned into air-raid shelters. Fish-eaters at Berlin and Hamburg were killed, their skins cured and their blubber converted into oil. Snake venom, fat and skins from reptiles in the Berlin zoo were utilized, but Dresden's famous collection of boas and pythons was spared. Edible fish from the big aquaria were sent to the markets. (V.R.)

Zoology.

General.—The American Society of Zoologists held its annual meeting at Columbus, Ohio, on Dec. 28, 29 and 30, 1939. At that meeting 309 papers were listed of which 26% were devoted to general physiology; 21% to embryology; 14% to endocrinology; 13% to ecology, morphology, and miscellaneous; 12% to cellular physiology; 7% to protozoology; and 7% to cytology and histology. In addition, animal genetics was represented in meetings of the Genetics Society of America by 36 papers and animal ecology in meetings of the Ecological Society of America by 32 papers.

Major Trends.—The year 1939 witnessed general trends in zoology that were largely continuations of research already in progress. Certain of these trends may be indicated as follows:

(1) There seemed to be a growing interest, coupled with collaboration, on the part of geneticists, embryologists and biochemists in the analysis of chemical aspects of differentiation and growth. Important examples were investigations dealing with (a) the chemical and structural nature of the gene; (b) the chemical properties of embryonic "organizers"; and (c) the role of hormones in development.

(2) There was a continuation and sharpening of interest in the study of animal populations. This subject was attacked actively along two frontiers. The geneticists, interested primarily in matters of evolution and speciation, were concerned with the statistical distribution of genes within single species populations under specified conditions of selection, mutation, isolation and population size. This aspect of zoology received formal recognition at the summer (Milwaukee, Wis.) and winter (Columbus, Ohio) meetings of the American Association for the Advancement of Science where speciation symposia were conducted. The ecologists continued their analyses of the growth and dynamic structure of field and laboratory populations. An important synthesis of work in this province was published by Thompson. There was evidence of a growing realization on the part of many zoologists that certain biological problems are populational in character and must be analyzed by treating a homogeneous group of organisms as an integrated whole.

(3) Zoology continued to develop as a quantitative science. Mathematical rationalizations and statistical treatment of data appeared frequently in research reports. A book entitled *Quantitative Zoology* by Simpson and Roe was published.

Specific Contributions.—*Morphology and Taxonomy.* One of the most spectacular scientific events of recent years had its origin on board a commercial fishing trawler off the coast of South Africa. While dragging nets in 40 fathoms of water, fisher-

men hauled in a large bony fish about five feet long and weighing over 125 pounds. On expert examination it was found that the fish belonged to a group, the Coelacanth, thought to be extinct for 50,000,000 years. In short, a truly "living-fossil" had been found. Zoologically there are two significant features in this catch. One feature remains an unanswered question: How has such a species been able to survive in the face of competition for so long a time? The other feature concerns the report of palaeontologists who, after studying the carcass and comparing it with fossil Coelacanth found in Bavaria, reached the tentative conclusion that there had been little evolutionary change between the modern form and its earlier progenitors. The fish was named *Latimeria chalumnae* and, at last report, was deposited in the museum of East London, South Africa. (See also MARINE BIOLOGY.)

Embryology.—An important contribution to experimental parthenogenesis appeared in the work of Pincus. This investigator collected unfertilized ova from the reproductive tract of female rabbits by subjecting them to hormonal treatment which induced superovulation. These eggs were then cultured *in vitro* and activated (*i.e.*, artificially induced to divide) by hypertonic salt solutions and supranormal temperatures. Some of the eggs started to develop even though they had not been fertilized by a spermatozoon. The developing eggs were then implanted in the uterus of another female rabbit that had been rendered physiologically capable of implantation by copulation with a sterile rabbit buck. Certain of these implanted eggs formed embryos and were born as normal young. The latter, interestingly enough, were children that never had a father and were born of a mother not their own. The new feature of this work was the successful activation of a rabbit's ovum by experimental treatment.

Genetics.—The significant event in the field of genetics for 1939 was the Seventh International Genetical Congress held at Edinburgh, Scotland, August 22 to 30. (See also GENETICS.)

Animal Behaviour.—A study published by Allee, Collias and Lutherman is particularly significant because it presages an important type of work yet to be developed. These investigators were able to modify experimentally a well established and complex behaviour process by the injection of vertebrate male hormone, testosterone propionate. It has been known for some time that a social order or "hierarchy" exists in flocks of hens. Such an order is established in the flock by dominant or despot birds pecking, and continuing to peck on contact, subordinate birds. This results in a group whose behaviour is shaped by the peck relations between the flock members. Once established, these peck relations may be quite persistent.

It follows that for any flock certain individual hens are consistently persecuted. Allee and his associates injected these low-ranking hens with male hormone to see if their social status, as evidenced by the pecking behaviour, could be improved. It was found that injected adult hens gradually rose under continued treatment to a place where they dominated the entire flock. In addition to altering the pecking behaviour, testosterone (a) caused the comb of the hens to increase in size; (b) retarded or suppressed egg-laying; (c) caused the hens to crow; and (d) stimulated certain hens to court other females. The major importance of this investigation, however, lies in its suggestion that behaviour problems can be attacked experimentally through endocrine manipulation. (See also AQUARIUMS; BACTERIOLOGY; ENTOMOLOGY; OCEANOGRAPHY; PALAEONTOLOGY.)

INDEX

The black type entries are article headings and cross references. These black type article entries do not show page notations because they are to be found in their alphabetical position in the body of the book, but they show the dates of the issues of the *Book of the Year* in which the articles appear. For example, "Academic Freedom 40, 39, 38" indicates that the entry "Academic Freedom" is to be found in the 1940 *Book of the Year*, the 1939 *Book of the Year* and the 1938 *Book of the Year*. The reference "Adult Education: see Education, Adult 40, 39. See Adult Education 38" indicates that the entry "Adult Education" is to be found under the heading "Education, Adult" in the 1940 *Book of the Year* and the 1939 *Book of the Year* and under the heading "Adult Education" in the 1938 *Book of the Year*.

The light type headings which are indented under black type article headings and cross references refer to articles elsewhere in the text (of this issue only) related to the entry listed in black type. The light type headings which are not indented refer to information in the text (of this issue only) not given a special article. All the light type headings show page references.

All headings whether consisting of a single word or more are treated for the purpose of alphabetization as single complete headings. Names beginning with "Mc" and "Mac" are alphabetized as "Mac"; "St." is treated as "Saint." All references below show the exact quarter of the page by means of the letters *a*, *b*, *c*, and *d*, signifying respectively the upper and lower halves of the first column and the upper and lower halves of the second column.
